ROGER LITTLE ROOM SIZES UP TO
21 m² with 5x/h air exchange*
35 m² with 3x/h air exchange**

*(heavy air pollution acc. to AHAM)

** (moderate air pollution & normal use)

Bad smells, volatile organic compounds, fine dust, pollen, viruses and bacteria can deteriorate our air quality. Our air purifiers Roger/Roger little show the air quality at home or in the office. They continuously measure the quality of the room air and immediately detect contamination. The air quality indicator lets you know if air quality deteriorates by changing its color. The specially-developed Dual Filter™ combines a HEPA and activated carbon filter. The HEPA filter is very efficient at purifying the air of pollutants and the activated carbon filter skillfully eliminates bad smells. Roger/Roger little take care of their role as household air improvers even more independently – with their auto mode which adjusts the cleaning performance to what is currently needed.
