Children's electric nose aspirator

## Electric Nose Inhaler – Instructions for Use

### Usage method

1. Before use, first immerse the suction mouth in warm saline for 10 minutes to disinfect, then install the nasal inhaler according to the instructions, then open the switch, and start to inhale nasal mucus and excrement from the nasal wall.

2. What about dry nose droppings? First spray into the nostrils with saline or nasal spray. The saline spray should fully contact the nasal cavity, and then use it after four or five minutes. Operational method of reusable nasal mucus in nasal cavity.

1. The sniffer can't touch the runny nose, so it needs to use the vacuum principle to suck the runny nose.

2. Let the baby stand or lie in a semi-lying state, head up if the runny nose is dry, wet the nasal cavity with saline or nasal spray first.

3. Open the sniffer adjustable transfer to two gears, sniffer about 45 degrees into the nostril with the sniffer completely blocked the nostril, leaving a closed space when sealed in place, the sound of the machine will become heavy.

4. At the same time, gently seal the other nostril with your finger, without being sealed. Just seal the nostril for 5-2 seconds at intervals - release - seal for 1-2 seconds - then release - to form a whole sealing space for the mucus, so that you can operate several times lock and forth until the nasal mucus is sucked out.

Other common methods of nasal excrement softening.

Method 1. Drop 1-2 drops of vegetable oil into the baby's nasal cavity, soften the dry nose excrement in 10-15 minutes, and then suck out the nose excrement with a sniffer. Fragrance oil plays a major role in moisturizing.

which has no side effects and is a traditional softening method. Doctors also suggest using the secondary method.

Method 2. Apply hot gauze or cotton swab dipped in hot water on both sides of baby's nose bridge, soften nose excrement 3-5 times in a row, and then inhale with nose aspirator.

Method 3. Drop liquid cod liver oil into baby's nose, wait for about 10-15 minutes, and then suck out nose droppings with sniffer. Please remember, parents, don't use tooth floss or hard mucus to suck baby's dry nose and excrement. According to customer feedback, method 1 has the best effect, and is also the most traditional method with the least side effects.

Can't solve the runny nose, hear the sneezing of nostrils, how to solve.

Tip 1. Use a baby's special cotton swab dipped in a little fragrance oil to gently get him out, a little bit to get a little suction, and wait a few days for him to be ready.

Tip 2. Slight nasal congestion with a hot towel outside the cover (functional to cover the baby's nose above the eyebrows, towel to be hot, wrapped will not burn skin on the line, red does not matter. Seriously, the ginger is chopped into pieces, tied in a pot, and then wrapped in gauze, and to the baby's feet).

Tip 3. Soak the onion with water, dip it in water with a towel, heat it dry (just too dry), and put the baby's nose. Just put it on a few more times.

Tip 4. Apply hot gauze or cotton swab dipped in hot water on both sides of baby's nose, but how long, nose the spit will come out.

Tip 5. It's more effective to drop the baby's nose with liquid cod liver oil, and then inhale with a sniffer.

Tip 6. You can try suction while 1-2 out off and put in a proper amount of milk steam, sometimes can relieve nasal congestion.

Tip 7. If the baby's nostrils are clean, let the baby smell cod oil or more kinds of essential oil. The smell of lemon or mint can sometimes daily congestion. Physical methods and room temperature can alleviate nasal congestion in babies.

1. Apply a warm towel to the nose. When the nasal mucus is abundant.

with heat, the nasal cavity will be more smooth and the thick runny nose will flow out easily, which can relieve the nasal congestion. Be sure to keep your movements gentle when applying hot compress.

2. Mothers can try to change their baby's position: lying right when the left nasal obstruction occurs, and lying left when the right nasal obstruction occurs, which can alleviate the nasal obstruction.

3. Nasal Acupoint Massage: Let older children take their seats (infants lying on their back). Massage them with thumbs and index fingers for 3 minutes from top to bottom on both sides of the nose wing, then massage Yingxiang acupoint (on both sides of the nose wing) for 1 minute. When the nose is hot, the breath will pass. Do it every 2 to 3 hours to relieve nasal congestion.

4. When a baby has a stuffy nose, he often cries nonstop. At this time, he can hold the baby upright. It can also reduce the stuffy nose and make the baby fall asleep easily.

5. When nasal obstruction affects a child's sleep, the child's head can be padded up by 30 degrees to alleviate symptoms.

6. Pay attention to indoor ventilation, because the weather is hot and dry, try to maintain the room temperature in the home at 24-26°C, humidity at 60%-70%. When it's cold, you can change the room temperature by air conditioning or heating stove to alleviate the symptoms of stuffy nose and runny nose.

### Be careful

Nasal aspirator is a physical product that absorbs runny nose and excrement. It is used for nasal congestion and runny nose caused by cold. Rhinitis is a nasal obstruction caused by the dilation of nasal capillaries due to pathological changes. It seems that there is a snotty breathing sound. In fact, it is not snotty, but the expansion of nasal capillaries makes the nasal cavity smaller and difficult to breathe.

Therefore, it is not possible to inhale except that the method is useless. But also that there is no runny nose in the nasal cavity. In this case, we want to dredge capillaries and promote blood circulation, such as applying hot towels to the root of the nose, or pounding ginger into the head of the feet. If you have tried a baby with severe nasal obstruction, our mother may consider seeking help from a doctor. If your baby runs his nose regularly, mothers should be careful. Many people's rhinitis is caused by the lack of timely treatment of colds in childhood. Often nasal congestion and runny nose cause rhinitis. They will follow up until they grow up. Parents are advised to take their babies to see a doctor in time to prevent the occurrence of rhinitis.
