FCC Interference Statement

This equipment has been tested and found to comply with the limits for a Class B digital device pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against radio interference in a commercial environment. This equipment can generate, use and radiate radio frequency energy and, if not installed and used in accordance with the instructions in this manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause interference, in which case the user, at his own expense, will be required to take whatever measures are necessary to correct the interference.

CE Declaration of Conformity

This equipment complies with the requirements relating to electromagnetic compatibility, EN 55022/A1 Class B.

The specification is subject to change without notice.

Introduction

Congratulations on your purchase of this outstanding Wireless Broadband Router. This product is specifically designed for Small Office and Home Office needs. It provides a complete SOHO solution for Internet surfing, and is easy to configure and operate even for non-technical users. Instructions for installing and configuring this product can be found in this manual. Before you install and use this product, please read this manual carefully for fully exploiting the functions of this product.

1.1 Packing List

items	Description	Contents	Quantity
1	WiFi Gigabit Router		1
2	Power adapter 12V 1A		1
3	CD		1

1.2 Spec Summary Table

Device Interface		
Ethernet WAN	RJ-45 port, 10/100/1000Mbps, auto-MDI/MDIX	1
Ethernet LAN	RJ-45 port, 10/100/1000Mbps, auto-MDI/MDIX	4
Antenna	3 dBi detachable antenna	2
WPS Button	For WPS connection	1
Wireless Enable/disable	To enable or disable Wireless Radio	1
LED Indication	Power/Status / WAN / LAN1 ~ LAN4/ WiFi	•
Power Jack	DC Power Jack, powered via external DC 12V/1A switching power adapter	1
Wireless LAN (WiFi)		
Standard	IEEE 802.11b/g/n compliance	•
SSID	SSID broadcast or in stealth mode	•
Channel	Auto-selection, manually	•
Security	WEP, WPA, WPA-PSK, WPA2, WPA2-PSK	•
WPS	WPS (Wi-Fi Protected Setup)	•
WMM	WMM (Wi-Fi Multimedia)	•
Functionality		
Ethernet WAN	PPPoE, DHCP client, Static IP, PPTP, L2TP	•
WAN Connection	Auto-reconnect, dial-on-demand, manually	•
One-to-Many NAT	Virtual server, special application, DMZ, Super DMZ (IP Passthrough)	•
NAT Session	Support NAT session	20000
SPI Firewall	IP/Service filter, URL blocking, MAC control	•
DoS Protection	DoS (Deny of Service) detection and protection	•
Routing Protocol	Static route, dynamic route (RIP v1/v2)	•
Management	SNMP, UPnP IGD, syslog, DDNS	•
Administration	Web-based UI, remote login, backup/restore setting	•
Performance	NAT up to 700Mbps and Wireless up to 150Mbps	

Environment & Certification		
Package Information	Package dimension (mm)	
	Package weight (g)	
Operation Temp.	Temp.: 0~40oC, Humidity 10%~90% non-condensing	•
Storage Temp.	Temp.: -10~70oC, Humidity: 0~95% non-condensing	•
EMI Certification	CE/FCC compliance	•
RoHS	RoHS compliance	•

1.3 Hardware Configuration

Figure 2-1 Front Panel

1.4 LED indicators

	LED status	Description
Status	Green in flash	Device status is working.
WAN LED	Green	RJ45 cable is plugged
	Green in flash	Data access
LAN LED	Green	RJ45 cable is plugged
	Green in flash	Data access
WiFi LED	Green	WLAN is on
	Green in flash	Data access
	Green in fast flash	Device is in WPS PBC mode
	Green in dark	Wi-Fi Radio is disabled

1.5 Procedure for Hardware Installation

Step 1. Attach the antenna.

1.1. Remove the antenna from its plastic wrapper.

1.2. Screw the antenna in a clockwise direction to the back panel of the unit.

1.3. Once secured, position the antenna upward at its connecting joint. This will ensure optimal reception.

1. Turn off the Power Switch first.

Step 2 Insert the Ethernet cable into LAN Port:

Insert the Ethernet patch cable into LAN port on the back panel of Router, and an available Ethernet port on the network adapter in the computer you will use to configure the unit.

Step 3 Insert the Ethernet patch cable into Wired WAN port:
Insert the Ethernet patch cable from DSL Modem into Wired WAN port on the back panel of Router.

Step 4. Power on Router:
4.1. Connect the power adapter to the receptor on the back panel of your Router and Push Power switch

Step 5. Complete the setup.
5.1. When complete, the Status LED will flash.

2

Getting Start

Insert the CD into CD reader on your PC. The program, AutoRun, will be executed automatically. And then you can click the Easy setup Icon for this utility. Configure the settings by the following steps.

2.1. Select Language then click “Next” for continues.

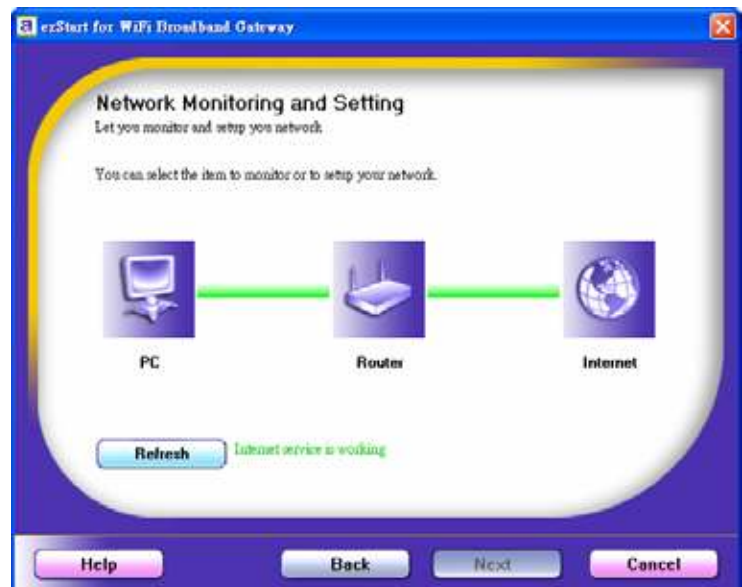

2.2 Setup mode

You can select Wizard mode to run the setup step-by-step or run advanced mode to diagnose the network settings of the router.

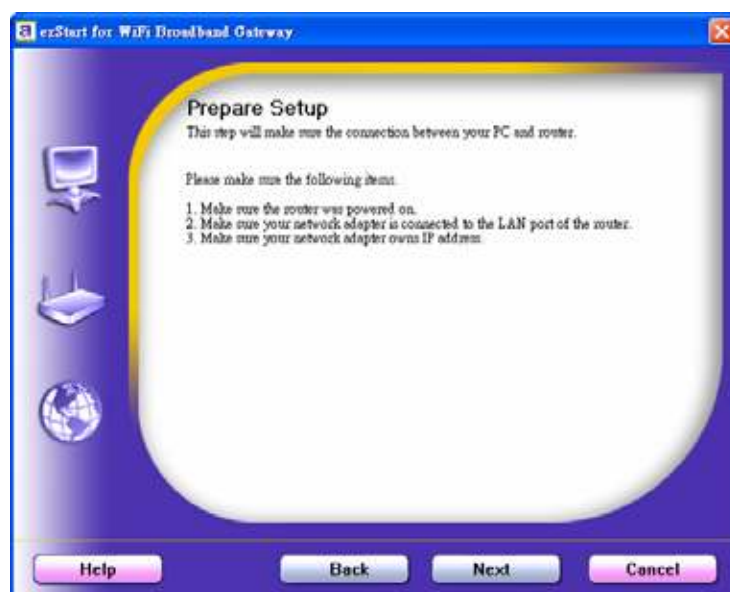

2.3 Advanced mode Setup.

Check the PC, Router or Internet icons for the Status of PC, Router or Internet.

2.4 Quick Wizard Install mode Setup

1. Make sure the router is powered on.
 2. Make sure your network adapter is connected to the LAN port of the router
 3. Make sure your network adapter has an IP address.
- Click "Next" for continues

- ## 2.5. Wireless Setting.
- Key in the SSID, Channel and Security options, and then click "Next" for continues.

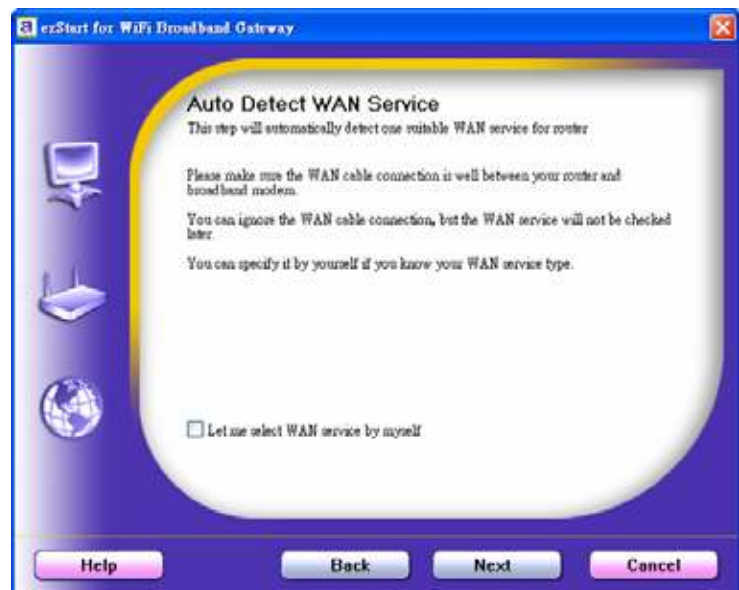

2.6 Auto Detect WAN Service.

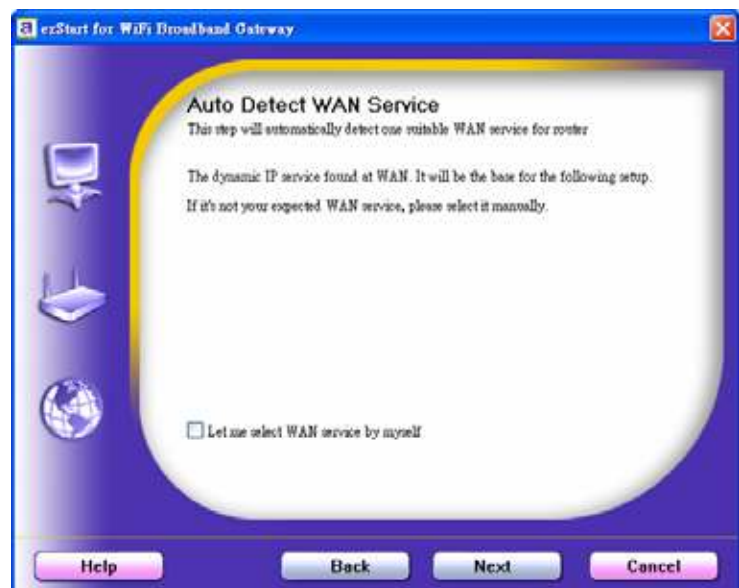

Click “Next” for continue.

Click the button, “Let me select WAN service by myself”, to disable this function.

Note: The Item supports to detect the Dynamic and PPPoE WAN Services only

Example, the Dynamic WAN type is detected.

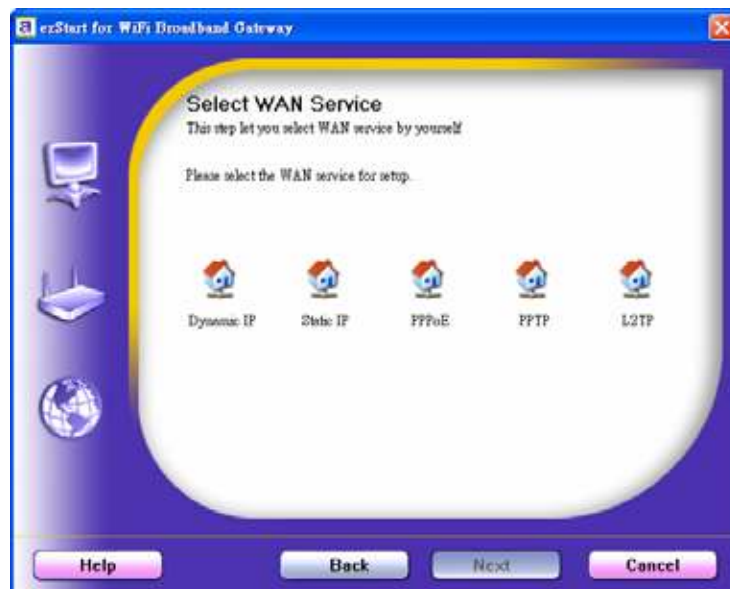

2.7. Manual select WAN Service

In the manual mode, Click the any icons for continues.

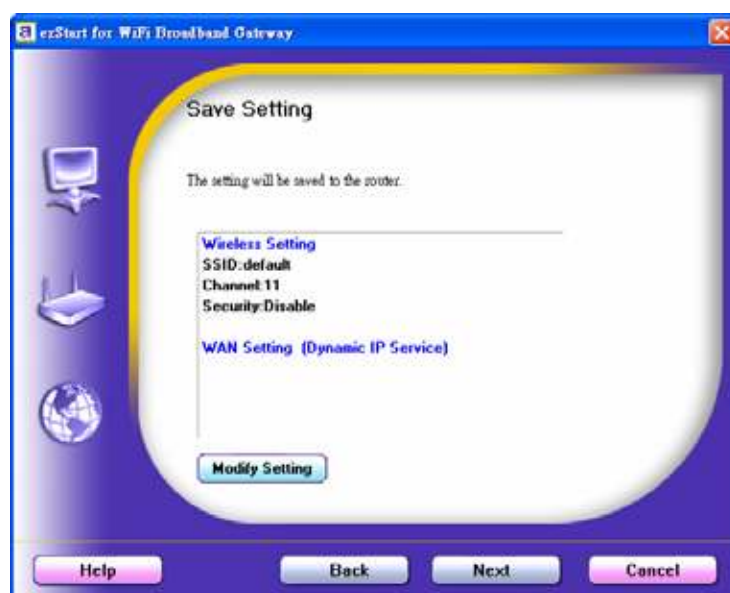

2.8 Summary of the settings and Next to "Reboot"

Click "Next" for continue.

2.9 Apply the Settings or Modify.

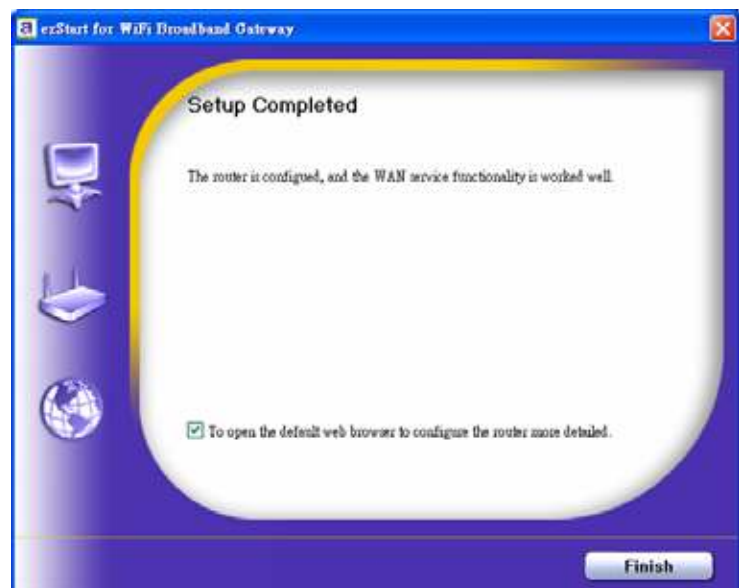

Click "Next" for continue.

2.10 Test the Internet connection.
Test WAN Networking service. Click
“Next” for continue.
You can ignore the by select the
“Ignore Test”.

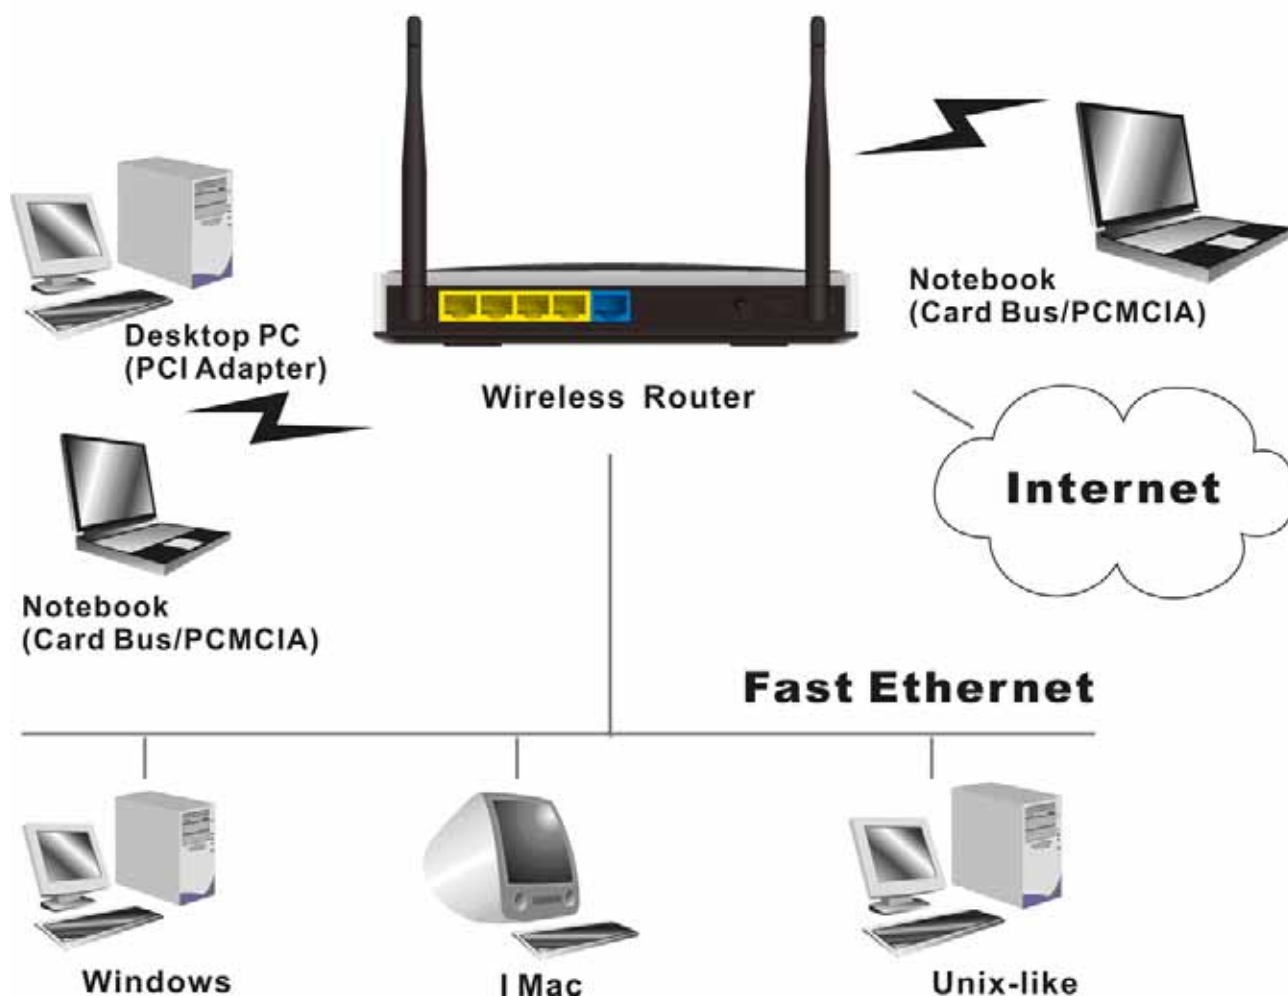

2.11 Setup Completed.
The EzSetup is finish, you can open
the default web browser to configure
advanced settings of the Router.
Click “Finish” to complete the
installation.

3

Making Configuration

This product provides Web based configuration scheme, that is, configuring by your Web browser, such as Mozilla Firefox or Internet Explorer. This approach can be adopted in any MS Windows, Macintosh or UNIX based platforms.

3.1 Login to Configure from Wizard

Type in the IP Address
(http://192.168.1.254)

Type password, the
default is “airlive” and click
'login' button.

Press “Wizard” for basic
settings with simple way.

Press “Next” to start
wizard.

Step 1:
Set up your system
password.

Step 2:
Select Wan Type.

Auto Detecting or
Setup Manually.

Step 3:

Setup the LAN IP and WAN Type.

The screenshot shows the 'Setup Wizard - WAN Settings - Dynamic IP Address' screen. It includes fields for LAN IP Address (192.168.1.254), Host Name, and WAN's MAC Address (00-50-18-21-04-57). There is a 'Clone MAC' button. The bottom navigation bar shows the progress: Start > Password > **WAN** > Wireless > Summary > Finish.

Step 4:

Please fill in PPPoE service information which is provided by your ISP.

Example:

The screenshot shows the 'Setup Wizard - WAN Settings - PPP over Ethernet' screen. It includes fields for LAN IP Address (192.168.1.254), Account, Password, Primary DNS (0.0.0.0), Secondary DNS (0.0.0.0), PPPoE Service Name, and Assigned IP Address (0.0.0.0). The bottom navigation bar shows the progress: Start > Password > **WAN** > Wireless > Summary > Finish.

Step 5:

Set up your Wireless.

The screenshot shows the 'Setup Wizard - Wireless settings' screen. It includes fields for Wireless function (radio buttons for Enable and Disable), Network ID (SSID) (default), and Channel (11). The bottom navigation bar shows the progress: Start > Password > WAN > **Wireless** > Summary > Finish.

Set up your Authentication and Encryption.

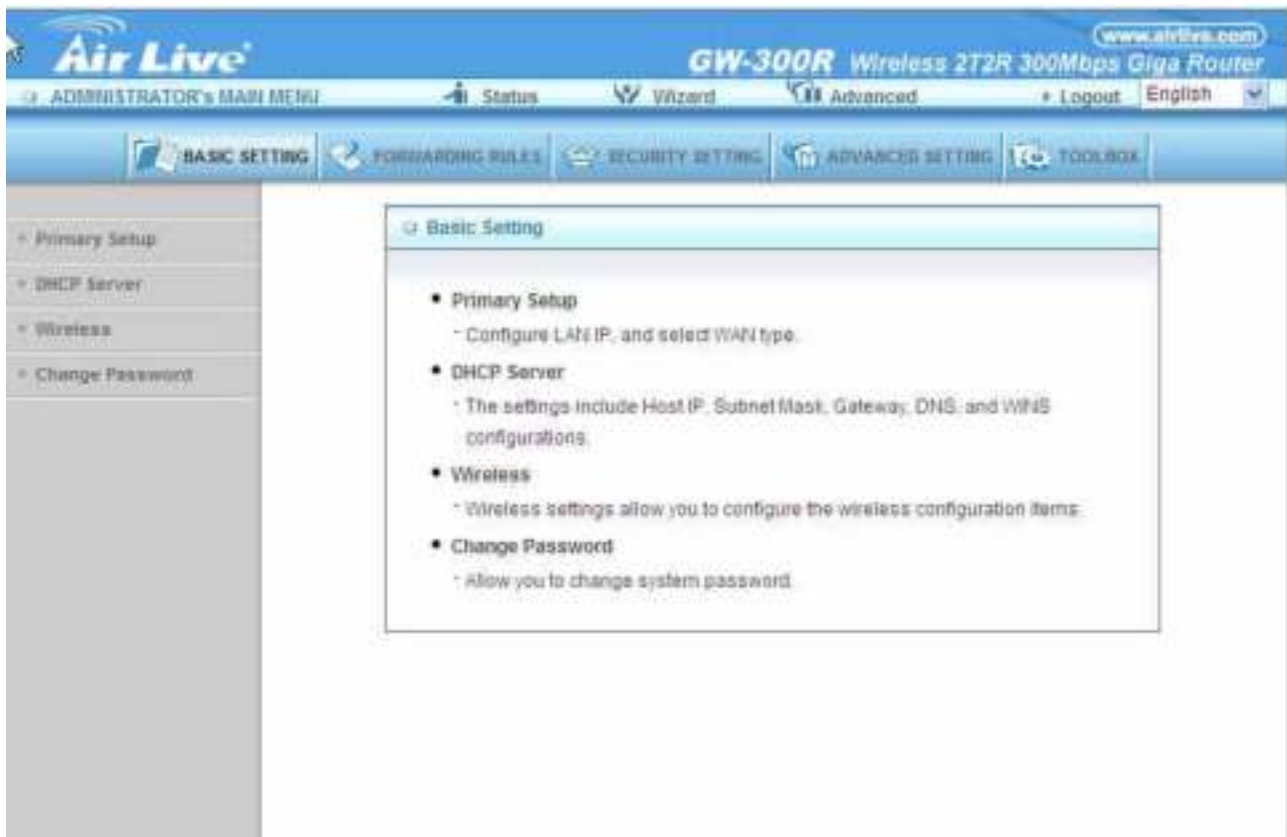

Step 6:
Then click Apply Setting.
And then the device will reboot.

Step 7:
Click Finish to complete it.

3.2 System Status

This option provides the function for observing this product's working status:
WAN Port Status.

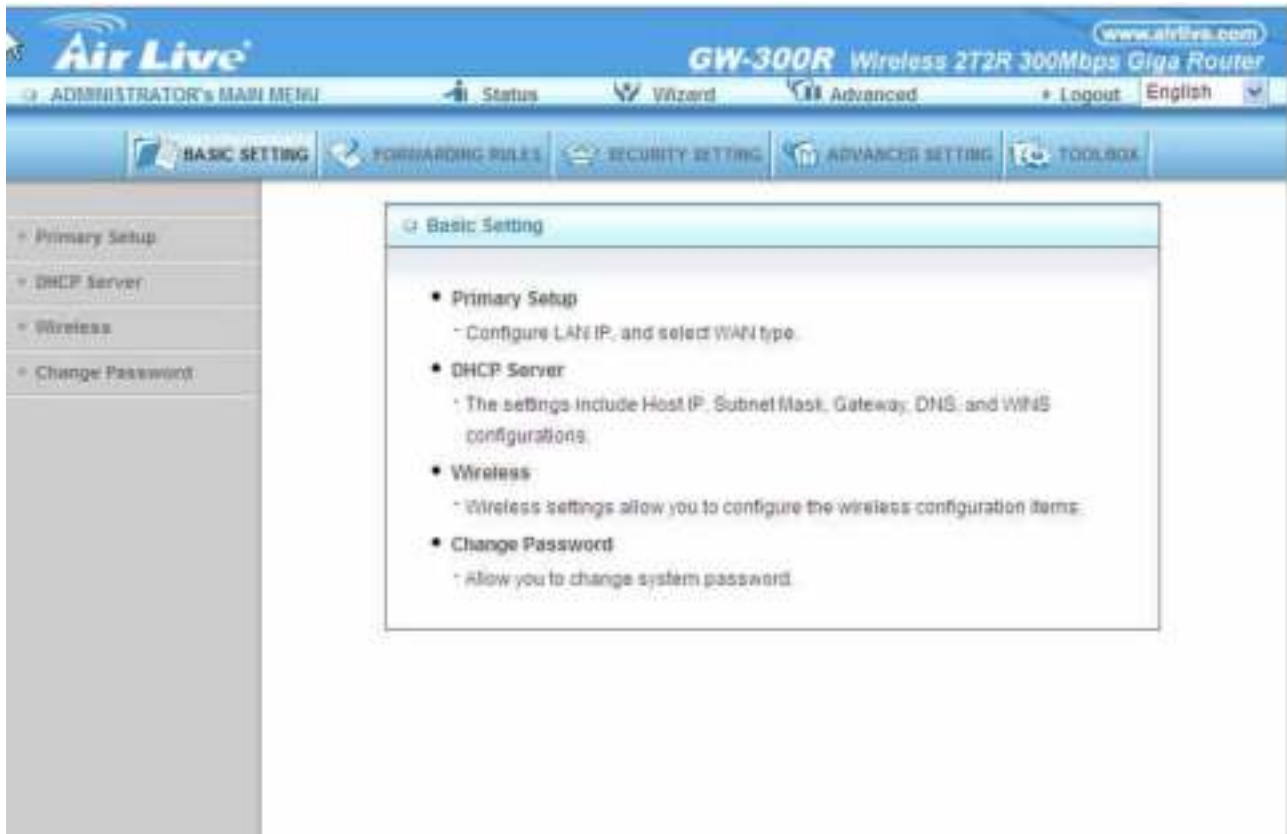

If the WAN port is assigned a dynamic IP, there may appear a "Renew" or "Release" button on the Sidenote column. You can click this button to renew or release IP manually.

Statistics of WAN: enables you to monitor inbound and outbound packets

3.3 Advanced

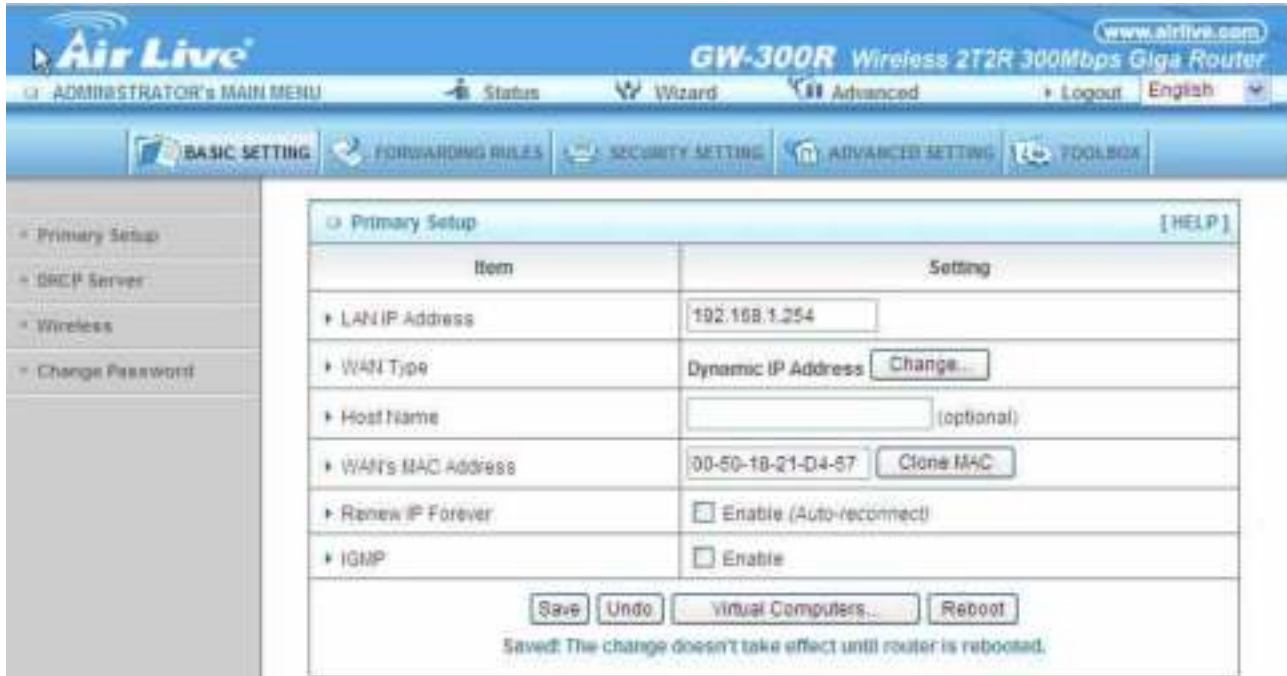

3.3.1 Basic Setting

Please Select “Advanced Setup” to Setup

3.3.1.1 Primary Setup – WAN Type, Virtual Computers

Press “Change”

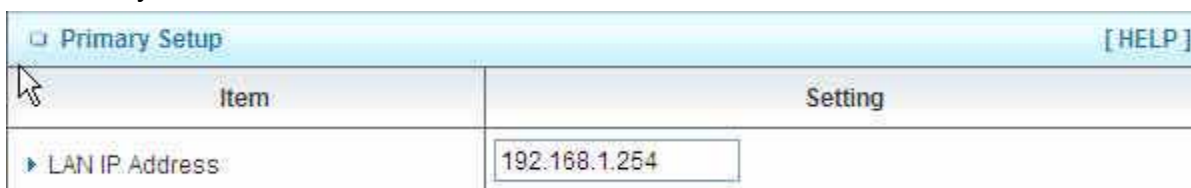

Item	Setting
LAN IP Address	192.168.1.254
WAN Type	Dynamic IP Address Change...
Host Name	<input type="text"/> (optional)
WAN's MAC Address	00-50-16-21-D4-57 Clone MAC
Renew IP Forever	<input type="checkbox"/> Enable (Auto-reconnect)
IGMP	<input type="checkbox"/> Enable

Save Undo [Virtual Computers...](#) Reboot

Saved: The change doesn't take effect until router is rebooted.

This option is primary to enable this product to work properly. The setting items and the web appearance depend on the WAN type. Choose correct WAN type before you start. LAN IP Address: the local IP address of this device. The computers on your network must use the LAN IP address of your product as their Default Gateway. You can change it if necessary.

Item	Setting
LAN IP Address	192.168.1.254

WAN Type: WAN connection type of your ISP. You can click Change button to choose a correct one from the following four options:

Static IP Address: ISP assigns you a static IP address.

Dynamic IP Address: Obtain an IP address from ISP automatically.

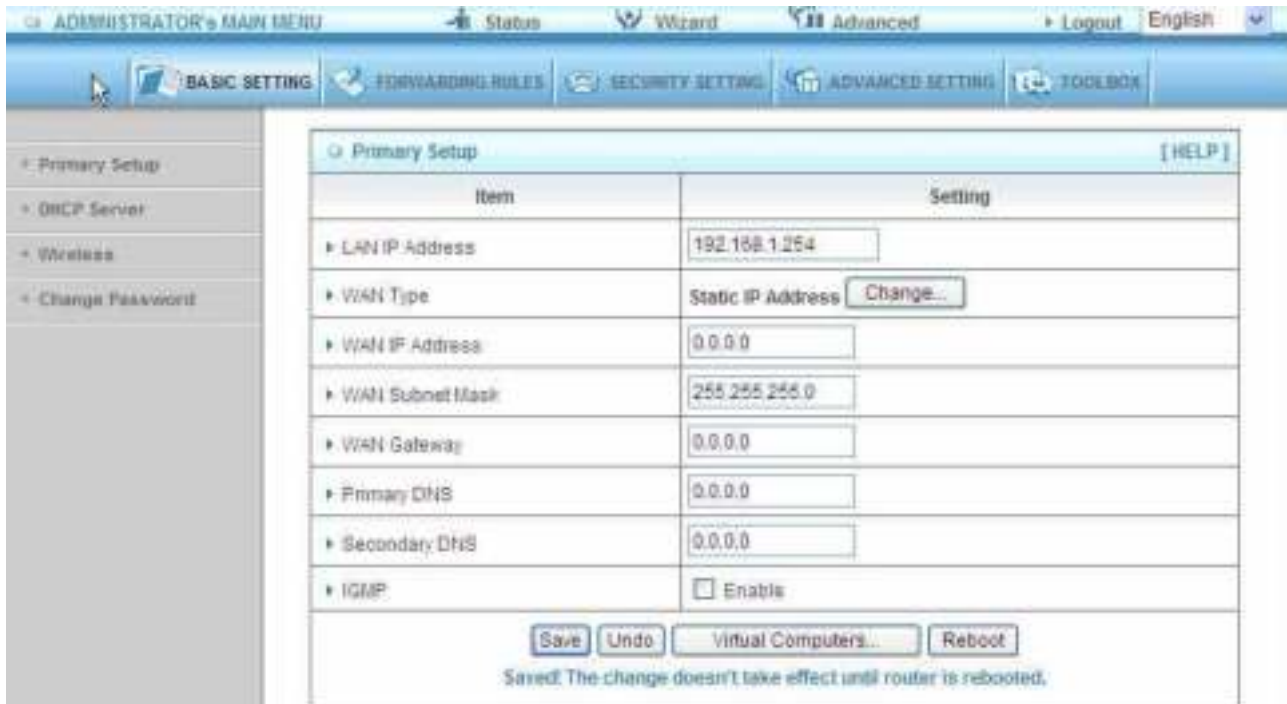

PPP over Ethernet: Some ISPs require the use of PPPoE to connect to their services.

PPTP: Some ISPs require the use of PPTP to connect to their services.

F. L2TP: Some ISPs require the use of L2TP to connect to their services

Static IP Address: ISP assigns you a static IP address:

WAN IP Address, Subnet Mask, Gateway, Primary and Secondary DNS: enter the proper setting provided by your ISP.

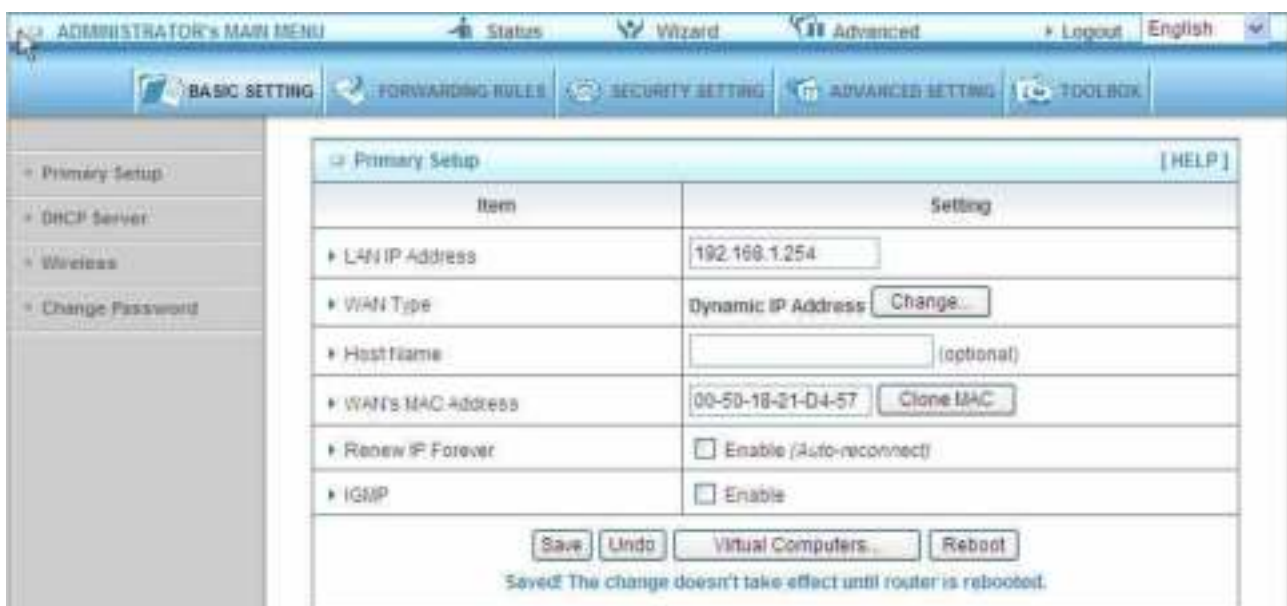

The screenshot shows the 'Primary Setup' page in the router's web interface. The 'WAN Type' is set to 'Static IP Address'. The 'LAN IP Address' is 192.168.1.254. The 'WAN IP Address' is 0.0.0.0, 'WAN Subnet Mask' is 255.255.255.0, 'WAN Gateway' is 0.0.0.0, 'Primary DNS' is 0.0.0.0, and 'Secondary DNS' is 0.0.0.0. The 'IGMP' checkbox is unchecked. At the bottom, there are buttons for 'Save', 'Undo', 'Virtual Computers...', and 'Reboot'. A message at the bottom states: 'Saved! The change doesn't take effect until router is rebooted.'

Item	Setting
LAN IP Address	192.168.1.254
WAN Type	Static IP Address Change...
WAN IP Address	0.0.0.0
WAN Subnet Mask	255.255.255.0
WAN Gateway	0.0.0.0
Primary DNS	0.0.0.0
Secondary DNS	0.0.0.0
IGMP	<input type="checkbox"/> Enable

Dynamic IP Address: Obtain an IP address from ISP automatically.

Host Name: optional. Required by some ISPs, for example, @Home.

Renew IP Forever: this feature enables this product to renew your IP address automatically when the lease time is expiring-- even when the system is idle.

The screenshot shows the 'Primary Setup' page in the router's web interface. The 'WAN Type' is set to 'Dynamic IP Address'. The 'LAN IP Address' is 192.168.1.254. The 'Host Name' field is empty with '(optional)' text. The 'WAN's MAC Address' is 00-50-18-21-D4-57. The 'Renew IP Forever' checkbox is unchecked, and the 'IGMP' checkbox is unchecked. At the bottom, there are buttons for 'Save', 'Undo', 'Virtual Computers...', and 'Reboot'. A message at the bottom states: 'Saved! The change doesn't take effect until router is rebooted.'

Item	Setting
LAN IP Address	192.168.1.254
WAN Type	Dynamic IP Address Change...
Host Name	<input type="text"/> (optional)
WAN's MAC Address	00-50-18-21-D4-57 Clone MAC
Renew IP Forever	<input type="checkbox"/> Enable (Auto-reconnect)
IGMP	<input type="checkbox"/> Enable

PPP over Ethernet: Some ISPs require the use of PPPoE to connect to their services. PPPoE Account and Password: the account and password your ISP assigned to you. For security, this field appears blank. If you don't want to change the password, leave it empty. PPPoE Service Name: optional. Input the service name if your ISP requires it. Otherwise, leave it blank.

Maximum Idle Time: the amount of time of inactivity before disconnecting your PPPoE session.

Set it to zero or enable Auto-reconnect to disable this feature.

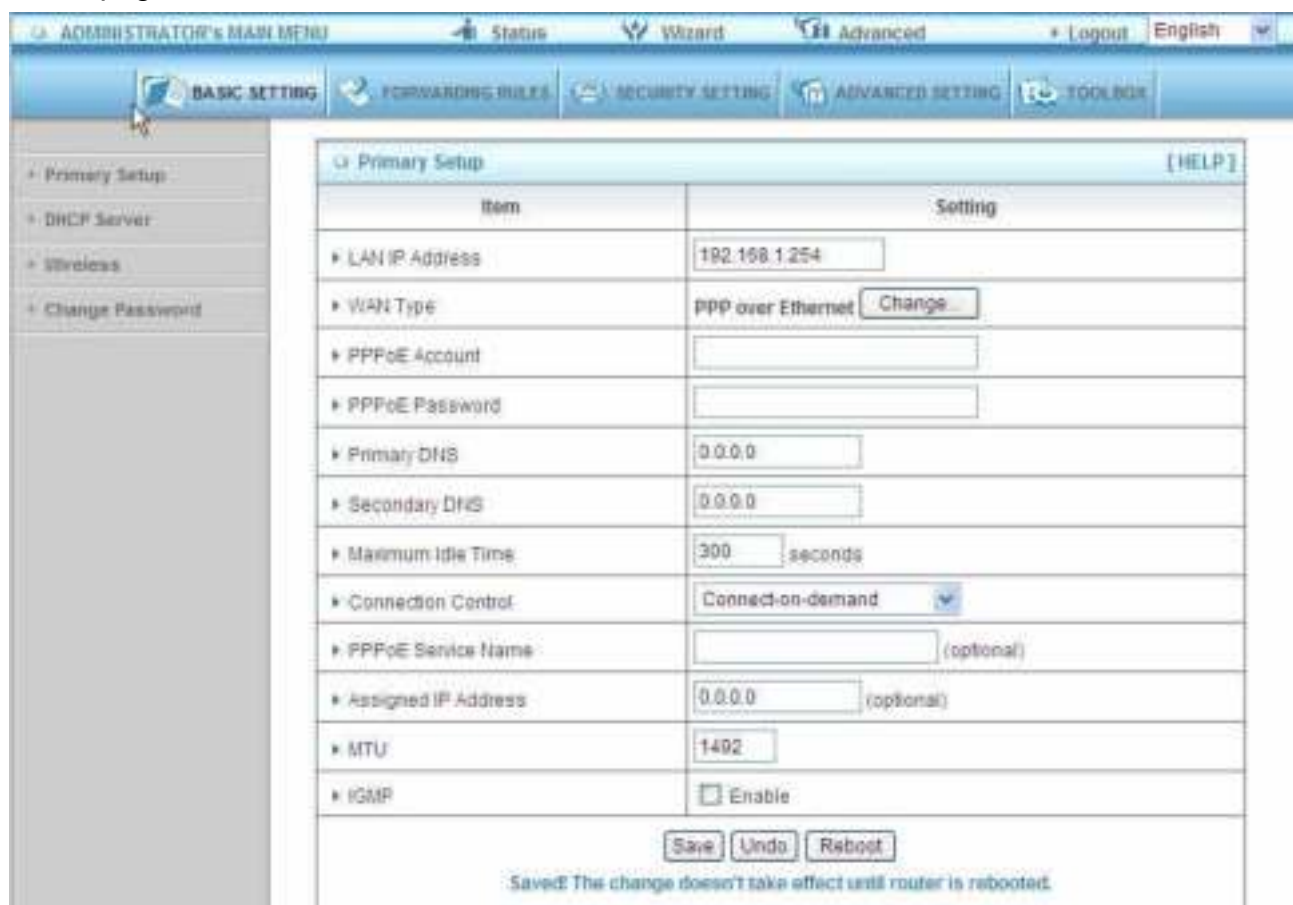

Maximum Transmission Unit (MTU): Most ISP offers MTU value to users. The most common MTU value is 1492.

Connection Control: There are 3 modes to select:

Connect-on-demand: The device will link up with ISP when the clients send outgoing packets.

Auto-Reconnect(Always-on):The device will link with ISP until the connection is established.

Manually : The device will not make the link until someone clicks the connect-button in the Staus-page.

The screenshot shows the 'ADMINISTRATOR'S MAIN MENU' with tabs for Status, Wizard, Advanced, Logout, and English. The 'BASIC SETTING' tab is selected, showing a sidebar with 'Primary Setup', 'DHCP Server', 'Wireless', and 'Change Password'. The 'Primary Setup' page contains a table with the following items and settings:

Item	Setting
LAN IP Address	192.168.1.254
WAN Type	PPP over Ethernet Change
PPPoE Account	
PPPoE Password	
Primary DNS	0.0.0.0
Secondary DNS	0.0.0.0
Maximum Idle Time	300 seconds
Connection Control	Connect-on-demand
PPPoE Service Name	(optional)
Assigned IP Address	0.0.0.0 (optional)
MTU	1492
IGMP	<input type="checkbox"/> Enable

At the bottom of the table are buttons for 'Save', 'Undo', and 'Reboot'. A message at the bottom states: 'Saved! The change doesn't take effect until router is rebooted.'

PPTP: Some ISPs require the use of PPTP to connect to their services

First, Please check your ISP assigned and Select Static IP Address or Dynamic IP Address.

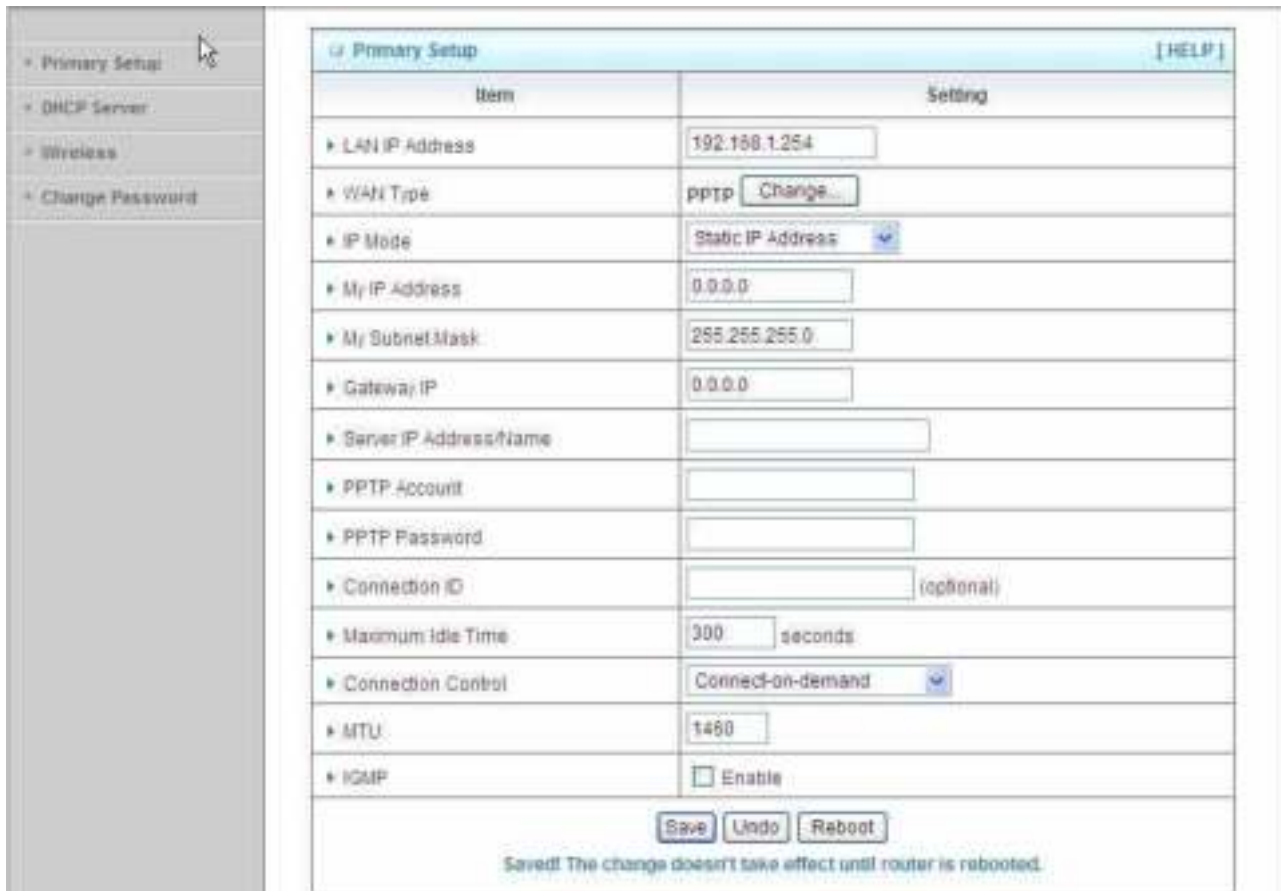

1. My IP Address and My Subnet Mask: the private IP address and subnet mask your ISP assigned to you.
2. Server IP Address: the IP address of the PPTP server.
3. PPTP Account and Password: the account and password your ISP assigned to you. If you don't want to change the password, keep it empty.
4. Connection ID: optional. Input the connection ID if your ISP requires it.
5. Maximum Idle Time: the time of no activity to disconnect your PPTP session. Set it to zero or enable Auto-reconnect to disable this feature. If Auto-reconnect is enabled, this product will connect to ISP automatically, after system is restarted or connection is dropped.

Connection Control: There are 3 modes to select:

Connect-on-demand: The device will link up with ISP when the clients send outgoing packets.

Auto-Reconnect(Always-on):The device will link with ISP until the connection is established.

Manually: The device will not make the link until someone clicks the connect-button in the Status-page.

Item	Setting
LAN IP Address	192.168.1.254
WAN Type	PPTP Change...
IP Mode	Static IP Address
My IP Address	0.0.0.0
My Subnet Mask	255.255.255.0
Gateway IP	0.0.0.0
Server IP Address/Name	
PPTP Account	
PPTP Password	
Connection ID	(optional)
Maximum Idle Time	300 seconds
Connection Control	Connect-on-demand
MTU	1460
IGMP	<input type="checkbox"/> Enable

Save Undo Reboot

Saved! The change doesn't take effect until router is rebooted.

L2TP: Some ISPs require the use of L2TP to connect to their services

First, Please check your ISP assigned and Select Static IP Address or Dynamic IP Address.

For example: Use Static

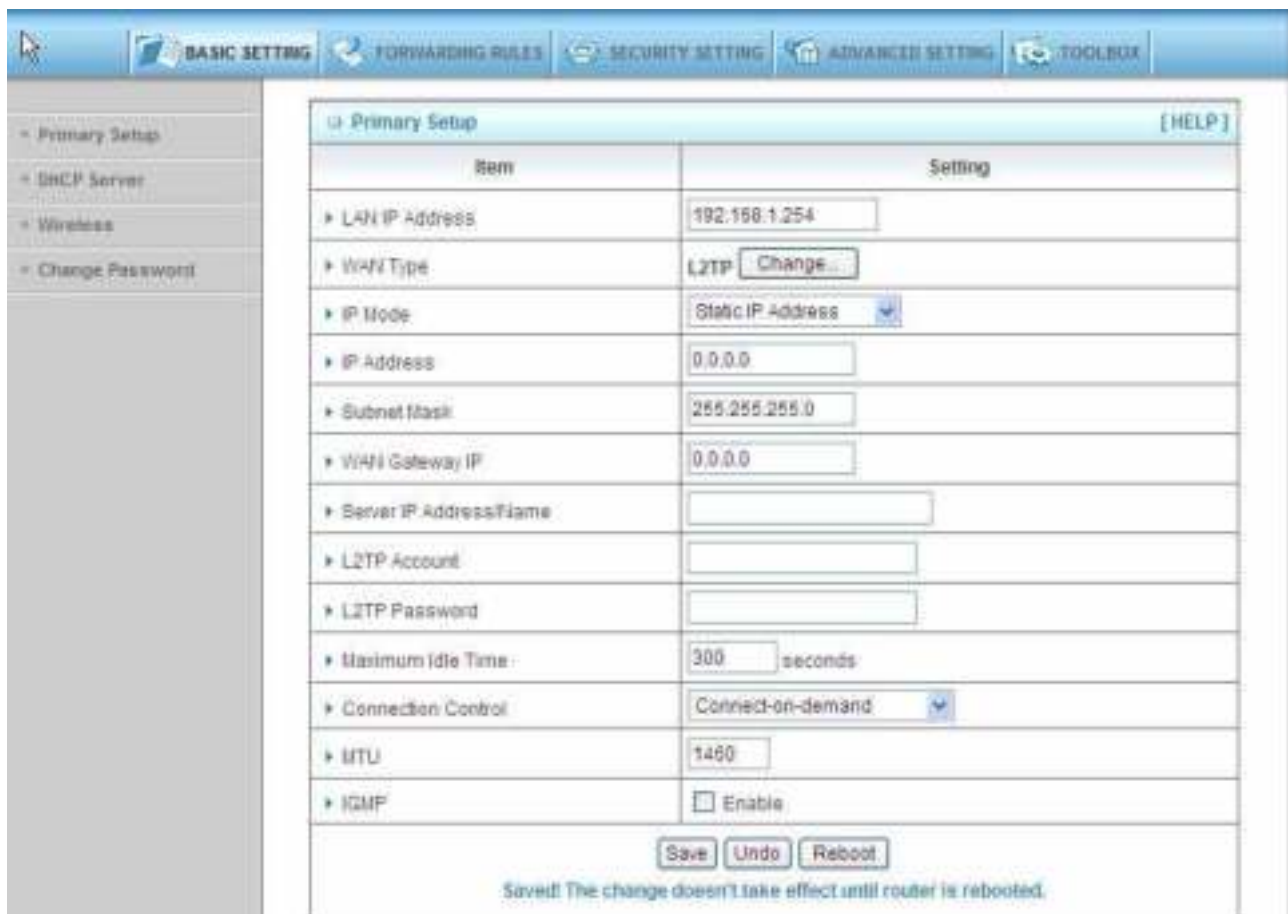

1. My IP Address and My Subnet Mask: the private IP address and subnet mask your ISP assigned to you.
2. Server IP Address: the IP address of the PPTP server.
3. PPTP Account and Password: the account and password your ISP assigned to you. If you don't want to change the password, keep it empty.
3. Connection ID: optional. Input the connection ID if your ISP requires it.
4. Maximum Idle Time: the time of no activity to disconnect your PPTP session. Set it to zero or enable Auto-reconnect to disable this feature. If Auto-reconnect is enabled, this product will connect to ISP automatically, after system is restarted or connection is dropped.

Connection Control: There are 3 modes to select:

Connect-on-demand: The device will link up with ISP when the clients send outgoing packets.

Auto-Reconnect(Always-on):The device will link with ISP until the connection is established.

Manually :The device will not make the link until someone clicks the connect-button in the Staus-page.

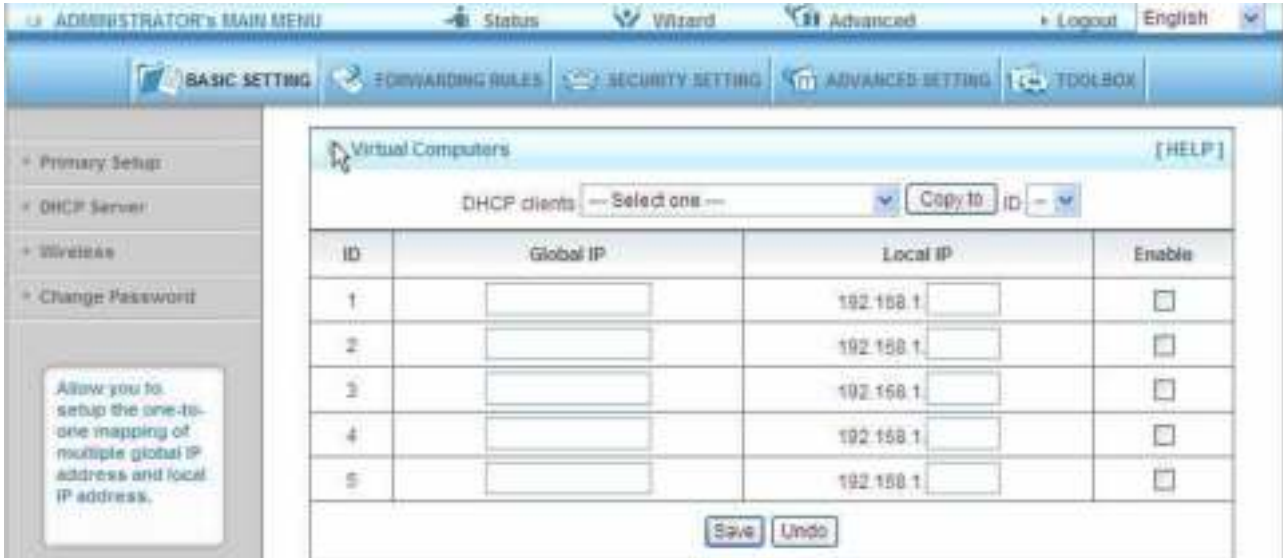

The screenshot shows the 'Primary Setup' configuration page in the AirLive GW-300R web interface. The page has a blue header with navigation tabs: BASIC SETTING, FORWARDING RULES, SECURITY SETTING, ADVANCED SETTING, and TOOLBOX. On the left, there is a sidebar with links: Primary Setup, SNCP Server, Wireless, and Change Password. The main content area is titled 'Primary Setup' and contains a table with the following items and settings:

Item	Setting
LAN IP Address	192.168.1.254
WAN Type	L2TP Change...
IP Mode	Static IP Address
IP Address	0.0.0.0
Subnet Mask	255.255.255.0
WAN Gateway IP	0.0.0.0
Server IP Address/Name	
L2TP Account	
L2TP Password	
Maximum Idle Time	300 seconds
Connection Control	Connect-on-demand
MTU	1460
IGMP	<input type="checkbox"/> Enable

At the bottom of the table, there are three buttons: Save, Undo, and Reboot. Below these buttons, a message states: 'Saved! The change doesn't take effect until router is rebooted.'

Secondary WINS	0.0.0.0
Gateway	0.0.0.0 (optional)

Save Undo Clients List

Press “More>>”

DHCP Server: Choose “Disable” or “Enable.”

Lease time: This is the length of time that the client may use the IP address it has been Assigned by dhcp server.

IP pool starting Address/ IP pool starting Address: Whenever there is a request, the DHCP server will automatically allocate an unused IP address from the IP address pool to the requesting computer. You must specify the starting and ending address of the IP address pool.

Domain Name: Optional, this information will be passed to the client.

Primary DNS/Secondary DNS: This feature allows you to assign DNS Servers

Primary WINS/Secondary WINS: This feature allows you to assign WINS Servers

Gateway: The Gateway Address would be the IP address of an alternate Gateway.

This function enables you to assign another gateway to your PC, when DHCP server offers an IP to your PC.

Wireless settings allow you to set the wireless configuration items.

Wireless : The user can enable or disable wireless function.

Wireless On/Off by time Schedule: The device can turn off Wireless depend as Schedule.

Network ID (SSID): Network ID is used for identifying the Wireless LAN (WLAN). Client stations can roam freely over this product and other Access Points that have the same Network ID. (The factory setting is "default")

SSID Broadcast: The router will Broadcast beacons that have some information, including ssid so that the wireless clients can know how many ap devices by scanning function in the network. Therefore, this function is disabled, the wireless clients can not find the device from beacons.

Channel: The radio channel number. The permissible channels depend on the Regulatory Domain.

WPS (WiFi Protection Setup)

WPS is WiFi Protection Setup which is similar to WCN-NET and offers safe and easy way in Wireless Connection.

Item	Setting
WPS	<input checked="" type="radio"/> Enable <input type="radio"/> Disable
Setup	<input checked="" type="radio"/> Current AP PIN <input type="radio"/> Configure Wireless Station

WPS status	Configured Release

[Save](#) [Reboot](#) [Back](#) [Release](#)

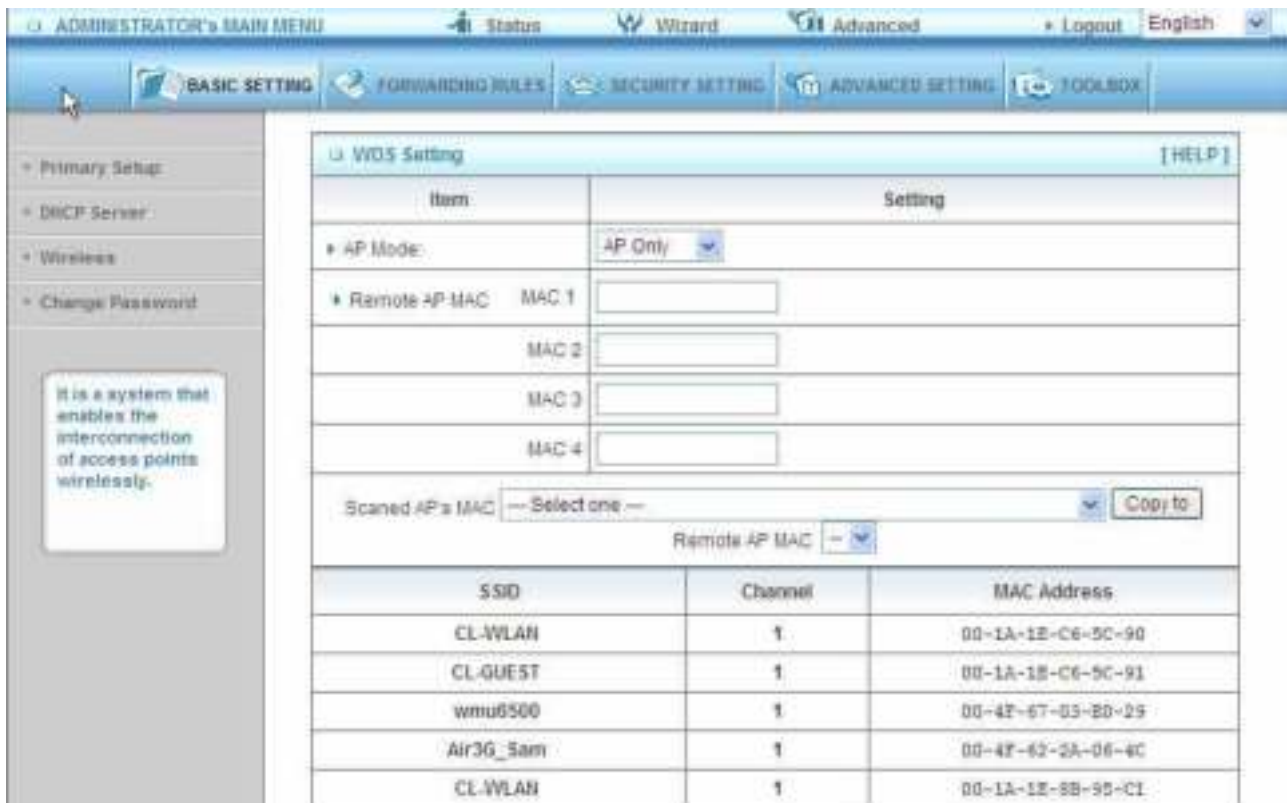

Saved! The change doesn't take effect until router is rebooted.

WDS(Wireless Distribution System)

WDS operation as defined by the IEEE802.11 standard has been made available. Using WDS it is possible to wirelessly connect Access Points, and in doing so extend a wired infrastructure to locations where cabling is not possible or inefficient to implement.

Hybrid Mode

It means the device can support WDS and AP Mode simultaneously.

Select Encryption and RADIUS Shared Key

If you select HEX, you have to fill in 64 hexadecimal (0, 1, 2...8, 9, A, B...F) digits

If ASCII, the length of pre-share key is from 8 to 63.

Key value shared by the RADIUS server and this router. This key value is consistent with the key value in the RADIUS server.

WPA2-PSK(AES)

1. Select Pre-share Key Mode

If you select HEX, you have to fill in 64 hexadecimal (0, 1, 2...8, 9, A, B...F) digits

If ASCII, the length of Pre-share key is from 8 to 63.

2. Fill in the key, Ex 12345678

WPA2(AES)

Check Box was used to switch the function of the WPA. When the WPA function is enabled, the Wireless user must authenticate to this router first to use the Network service. RADIUS Server

IP address or the 802.1X server's domain-name.

Select RADIUS Shared Key

If you select HEX, you have to fill in 64 hexadecimal (0, 1, 2...8, 9, A, B...F) digits

If ASCII, the length of Pre-share key is from 8 to 63.

Key value shared by the RADIUS server and this router. This key value is consistent with the key value in the RADIUS server.

WPA-PSK /WPA2-PSK

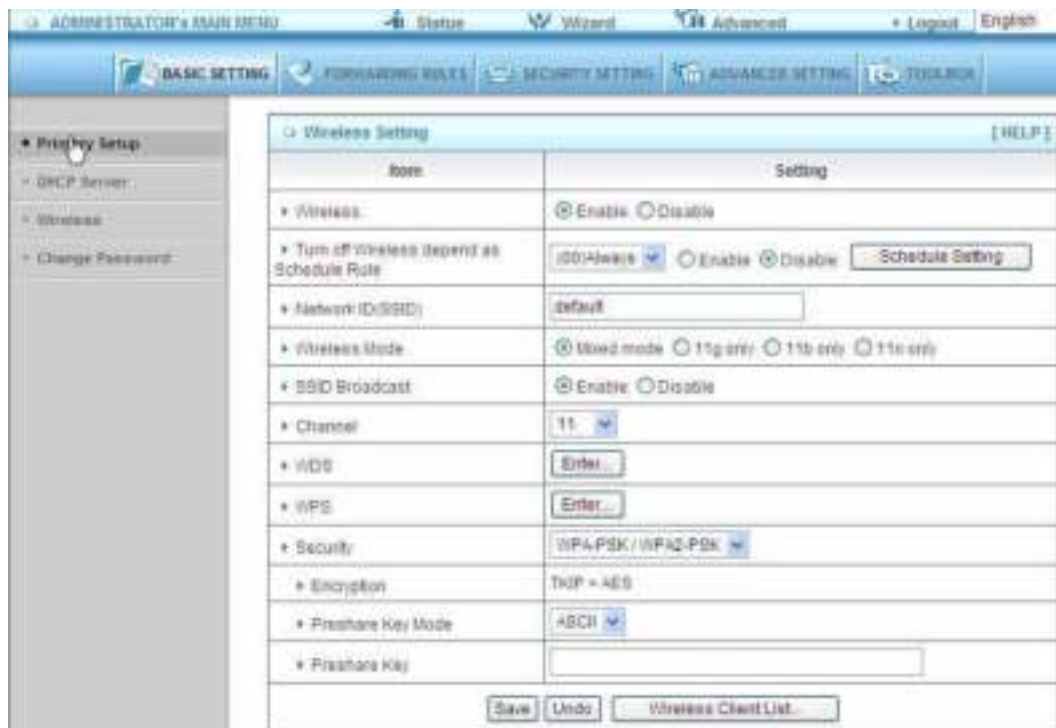

The router will detect automatically which Security type the client uses to encrypt.

1. Select Pre-share Key Mode

If you select HEX, you have to fill in 64 hexadecimal (0, 1, 2...8, 9, A, B...F) digits

If ASCII, the length of Pre-share key is from 8 to 63.

2. Fill in the key, Ex 12345678

3.3.1.4 Change Password

Item	Setting
Old Password	<input type="text"/>
New Password	<input type="text"/>
Reconfirm	<input type="text"/>
<input type="button" value="Save"/> <input type="button" value="Undo"/>	

You can change Password here. We strongly recommend you to change the system password for security reason.

3.3.2 Forwarding Rules

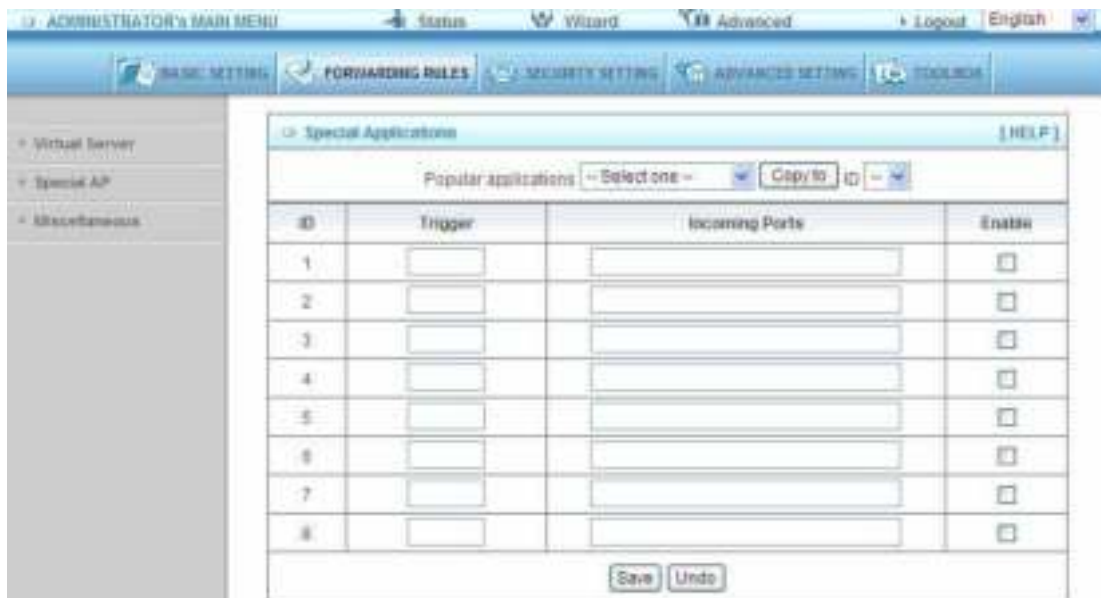

3.3.2.1 Virtual Server

This product's NAT firewall filters out unrecognized packets to protect your Intranet, so all hosts behind this product are invisible to the outside world. If you wish, you can make some of them accessible by enabling the Virtual Server Mapping.

A virtual server is defined as a Service Port, and all requests to this port will be redirected to the computer specified by the Server IP. Virtual Server can work with Scheduling Rules, and give user more flexibility on Access control. For Detail, please refer to Scheduling Rule.

3.3.2.2 Special AP

ID	Trigger	Incoming Ports	Enable
1	<input type="text"/>	<input type="text"/>	<input type="checkbox"/>
2	<input type="text"/>	<input type="text"/>	<input type="checkbox"/>
3	<input type="text"/>	<input type="text"/>	<input type="checkbox"/>
4	<input type="text"/>	<input type="text"/>	<input type="checkbox"/>
5	<input type="text"/>	<input type="text"/>	<input type="checkbox"/>
6	<input type="text"/>	<input type="text"/>	<input type="checkbox"/>
7	<input type="text"/>	<input type="text"/>	<input type="checkbox"/>
8	<input type="text"/>	<input type="text"/>	<input type="checkbox"/>

Some applications require multiple connections, like Internet games, Video conferencing, Internet telephony, etc. Because of the firewall function, these applications cannot work with a pure NAT router. The Special Applications feature allows some of these applications to work with this product. If the mechanism of Special Applications fails to make an application work, try setting your computer as the DMZ host instead.

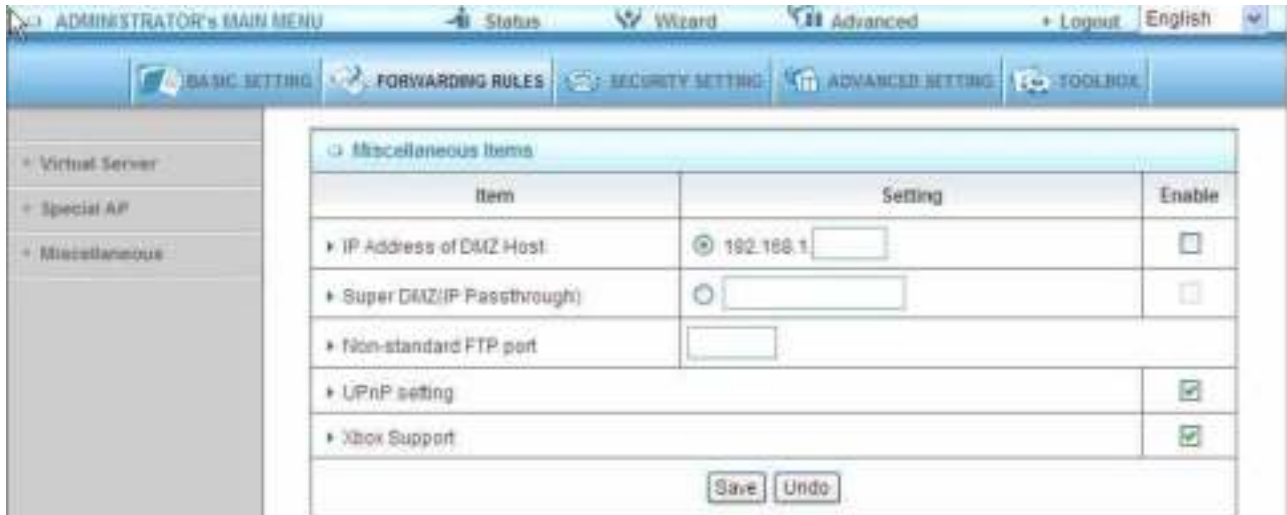

Trigger: the outbound port number issued by the application..

Incoming Ports: when the trigger packet is detected, the inbound packets sent to the specified port numbers are allowed to pass through the firewall.

This product provides some predefined settings. Select your application and click Copy to to add the predefined setting to your list.

Note! At any given time, only one PC can use each Special Application tunnel.

3.3.2.3 Miscellaneous Items

Item	Setting	Enable

UPnP setting		<input checked="" type="checkbox"/>
Xbox Support		<input checked="" type="checkbox"/>

Save Undo

IP Address of DMZ Host

DMZ (DeMilitarized Zone) Host is a host without the protection of firewall. It allows a computer to be exposed to unrestricted 2-way communication for Internet games, Video conferencing, Internet telephony and other special applications.

NOTE: This feature should be used only when needed.

Super DMZ (IP Passthrough)

Super DMZ (IP Passthrough) is a useful feature if a host computer or server on the Local Area Network needs to have access into it from the internet with a real public IP address. With IP Passthrough configured, all IP traffic, not just TCP/UDP, is forwarded back to the host computer. This can be necessary with certain types of software that do not function reliably through Network Address Translation.

Non-standard FTP port

You have to configure this item if you want to access an FTP server whose port number is not 21. This setting will be lost after rebooting.

Xbox Support

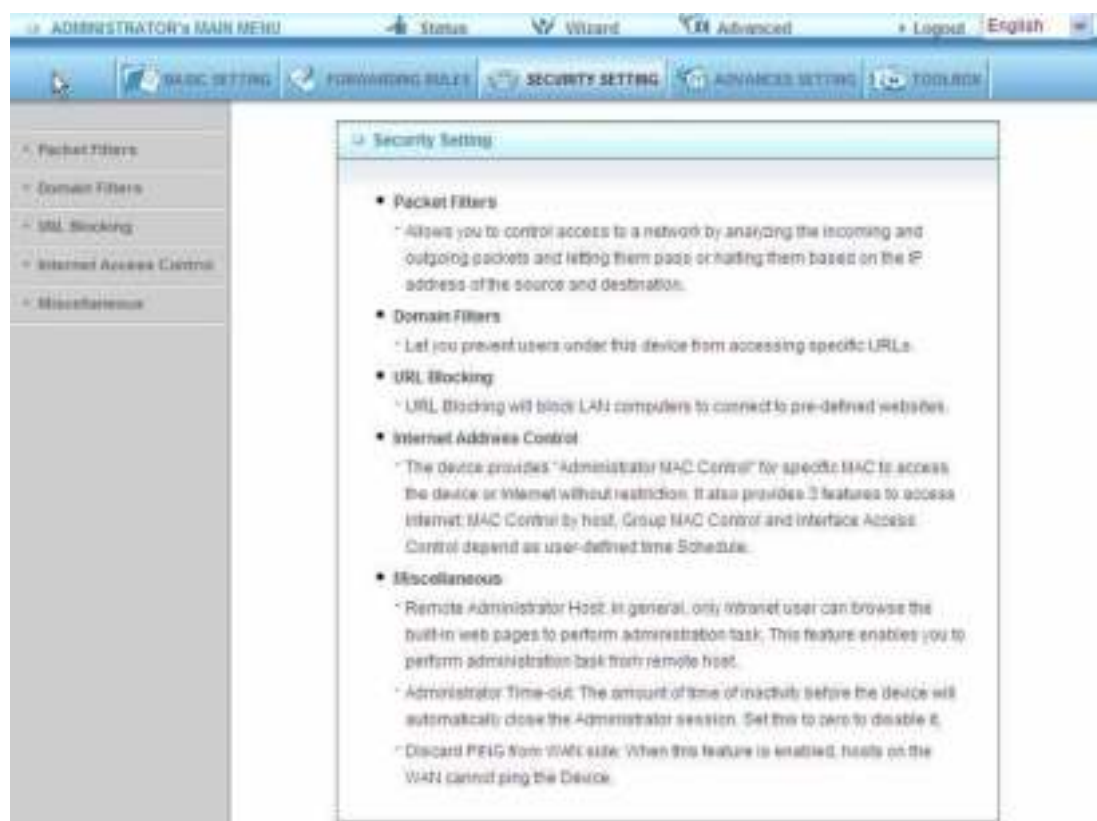

The Xbox is a video game console produced by Microsoft Corporation. Please enable this function when you play games.

UpnP Setting

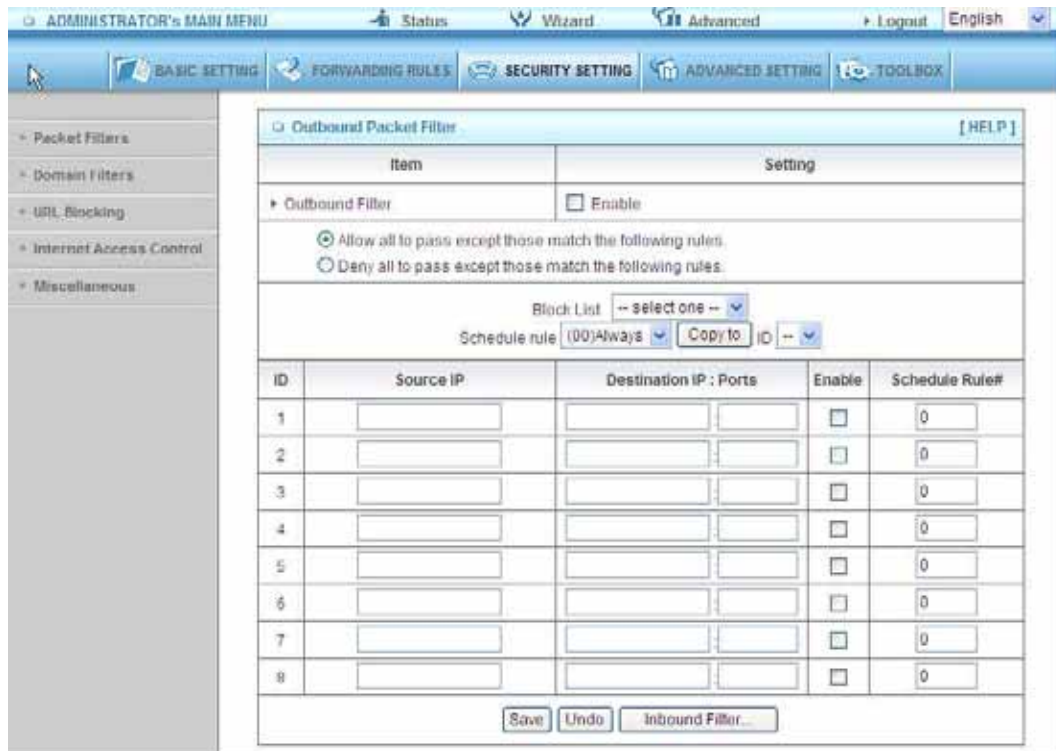

The device also supports this function. If the OS supports this function enable it, like Windows Xp. When the user gets IP from the device and will see icon as below:

3.3.3 Security Settings

3.3.3.1 Packet Filters

ID	Source IP	Destination IP : Ports	Enable	Schedule Rule#
1			<input type="checkbox"/>	0
2			<input type="checkbox"/>	0
3			<input type="checkbox"/>	0
4			<input type="checkbox"/>	0
5			<input type="checkbox"/>	0
6			<input type="checkbox"/>	0
7			<input type="checkbox"/>	0
8			<input type="checkbox"/>	0

Packet Filter enables you to control what packets are allowed to pass the router. Outbound filter applies on all outbound packets. However, Inbound filter applies on packets that destined to Virtual Servers or DMZ host only. You can select one of the two filtering policies:

Allow all to pass except those match the specified rules

Deny all to pass except those match the specified rules

You can specify 8 rules for each direction: inbound or outbound. For each rule, you can define the following:

Source IP address

Source port address

Destination IP address

Destination port address

Protocol: TCP or UDP or both.

Use Rule#

For source or destination IP address, you can define a single IP address (4.3.2.1) or a range of IP addresses (4.3.2.1-4.3.2.254). An empty implies all IP addresses.

For source or destination port, you can define a single port (80) or a range of ports (1000-1999). Add prefix "T" or "U" to specify TCP or UDP protocol. For example, T80, U53, U2000-2999. No prefix indicates both TCP and UDP are defined. An empty implies all port addresses. Packet Filter can work with Scheduling Rules, and give user more flexibility on Access control. For Detail, please refer to Scheduling Rule.

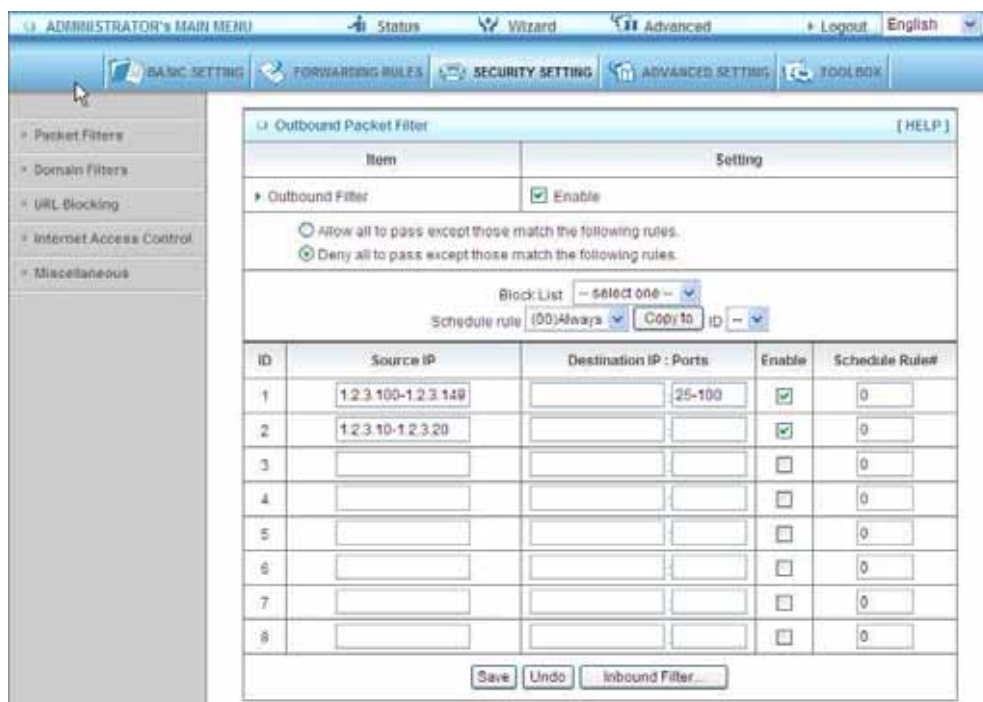

Each rule can be enabled or disabled individually.

Inbound Filter:

To enable Inbound Packet Filter click the check box next to Enable in the Inbound Packet Filter field.

Suppose you have SMTP Server (25), POP Server (110), Web Server (80), FTP Server (21), and News Server (119) defined in Virtual Server or DMZ Host.

Example 1:

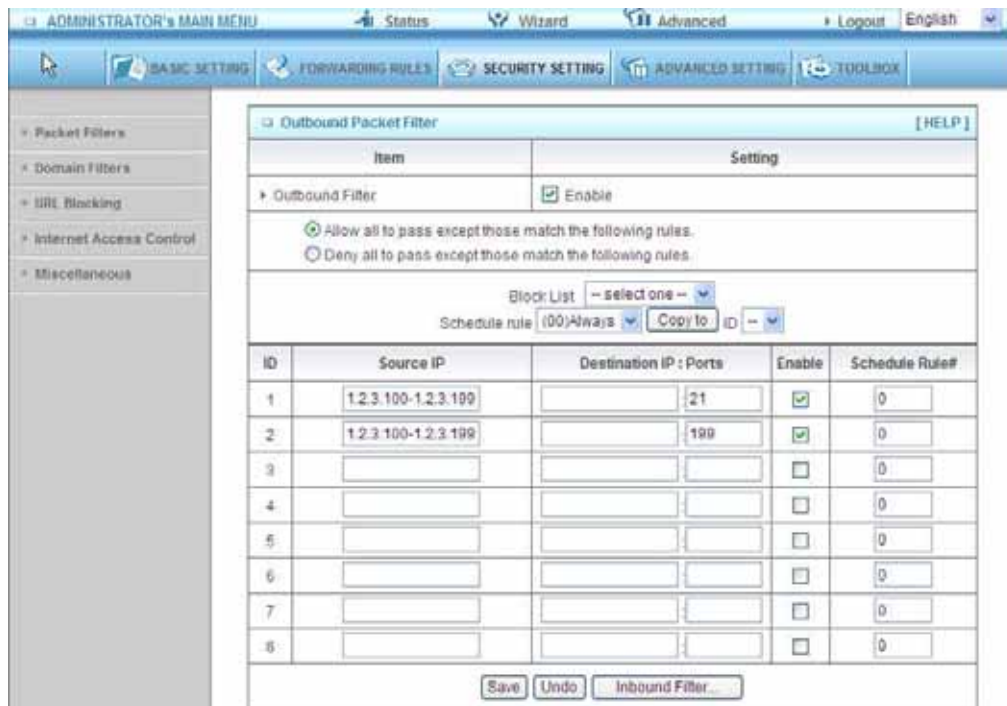

ID	Source IP	Destination IP : Ports	Enable	Schedule Rule#
1	1.2.3.100-1.2.3.149	25-100	<input checked="" type="checkbox"/>	0
2	1.2.3.10-1.2.3.20		<input checked="" type="checkbox"/>	0
3			<input type="checkbox"/>	0
4			<input type="checkbox"/>	0
5			<input type="checkbox"/>	0
6			<input type="checkbox"/>	0
7			<input type="checkbox"/>	0
8			<input type="checkbox"/>	0

(1.2.3.100-1.2.3.149) Remote hosts are allow to send mail (port 25), and browse the Internet (port 80)

(1.2.3.10-1.2.3.20) Remote hosts can do everything (block nothing)

Others are all blocked.

Item | Setting

Outbound Filter ☒ Enable

☒ Allow all to pass except those match the following rules.
☐ Deny all to pass except those match the following rules.

Block List -- select one --
Schedule rule (00)Always Copy to ID --

ID	Source IP	Destination IP : Ports	Enable	Schedule Rule#
1	1.2.3.100-1.2.3.119	21	<input checked="" type="checkbox"/>	0
2	1.2.3.100-1.2.3.119	119	<input checked="" type="checkbox"/>	0
3			<input type="checkbox"/>	0
4			<input type="checkbox"/>	0
5			<input type="checkbox"/>	0
6			<input type="checkbox"/>	0
7			<input type="checkbox"/>	0
8			<input type="checkbox"/>	0

Save Undo Inbound Filter...

(1.2.3.100-1.2.3.119) Remote hosts can do everything except read net news (port 119) and transfer files via FTP (port 21) behind Router Server.
Others are all allowed.

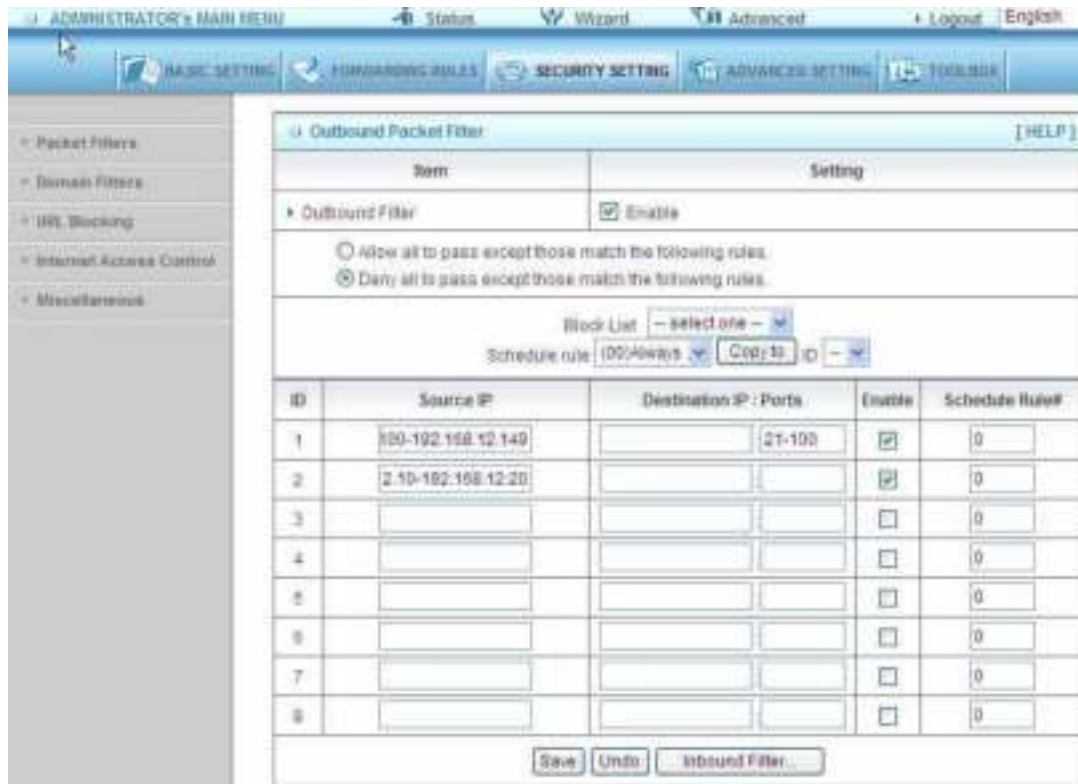

After Inbound Packet Filter setting is configured, click the save button.

Outbound Filter:

To enable Outbound Packet Filter click the check box next to Enable in the Outbound Packet Filter field.

Example 1:

Router LAN IP is 192.168.12.254

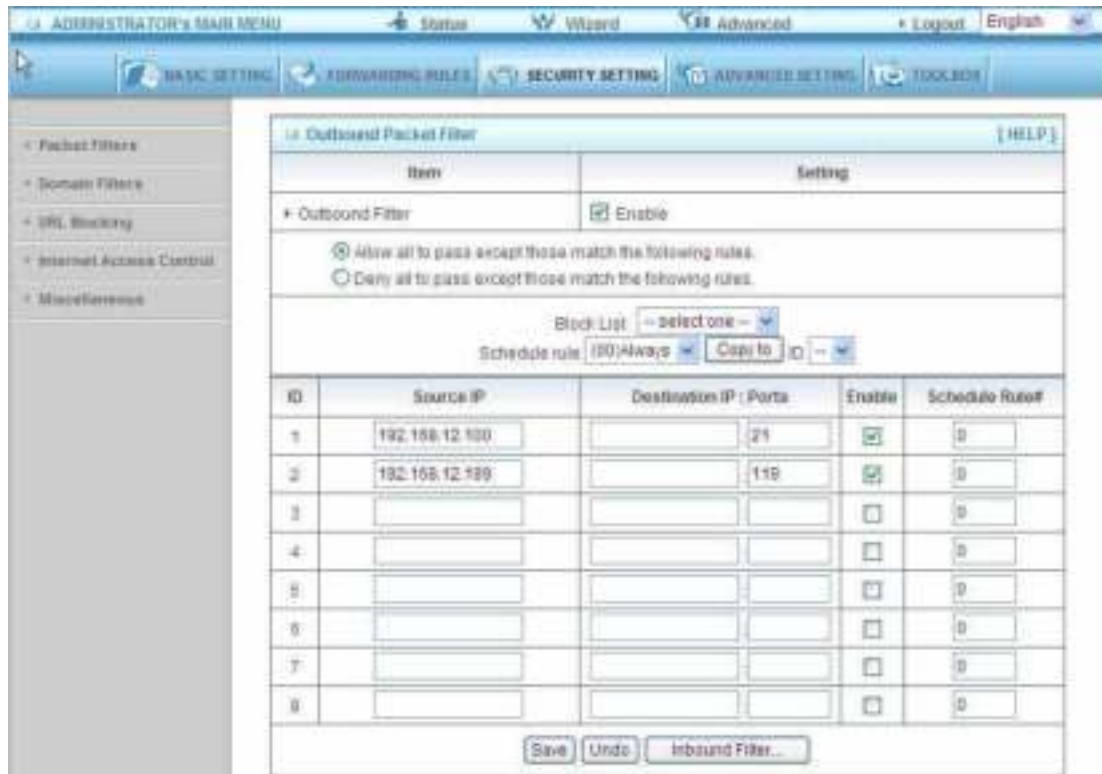

ID	Source IP	Destination IP : Ports	Enable	Schedule Rule
1	100-192.168.12.149	21-100	<input checked="" type="checkbox"/>	0
2	2.10-192.168.12.20		<input checked="" type="checkbox"/>	0
3			<input type="checkbox"/>	0
4			<input type="checkbox"/>	0
5			<input type="checkbox"/>	0
6			<input type="checkbox"/>	0
7			<input type="checkbox"/>	0
8			<input type="checkbox"/>	0

(192.168.12.100-192.168.12.149) Located hosts are only allowed to send mail (port 25), receive mail (port 110), and browse Internet (port 80); port 53 (DNS) is necessary to resolve the domain name.

(192.168.12.10-192.168.12.20) Located hosts can do everything (block nothing)
Others are all blocked.

Example 2:

Router LAN IP is 192.168.12.254

The screenshot shows the 'Outbound Packet Filter' configuration page. The 'Enable' checkbox is checked. The 'Block List' is set to 'select one' and the 'Schedule rule' is set to '180/Always'. The table below shows the configured rules.

ID	Source IP	Destination IP : Ports	Enable	Schedule Rule#
1	192.168.12.100	21	<input checked="" type="checkbox"/>	0
2	192.168.12.119	119	<input checked="" type="checkbox"/>	0
3			<input type="checkbox"/>	0
4			<input type="checkbox"/>	0
5			<input type="checkbox"/>	0
6			<input type="checkbox"/>	0
7			<input type="checkbox"/>	0
8			<input type="checkbox"/>	0

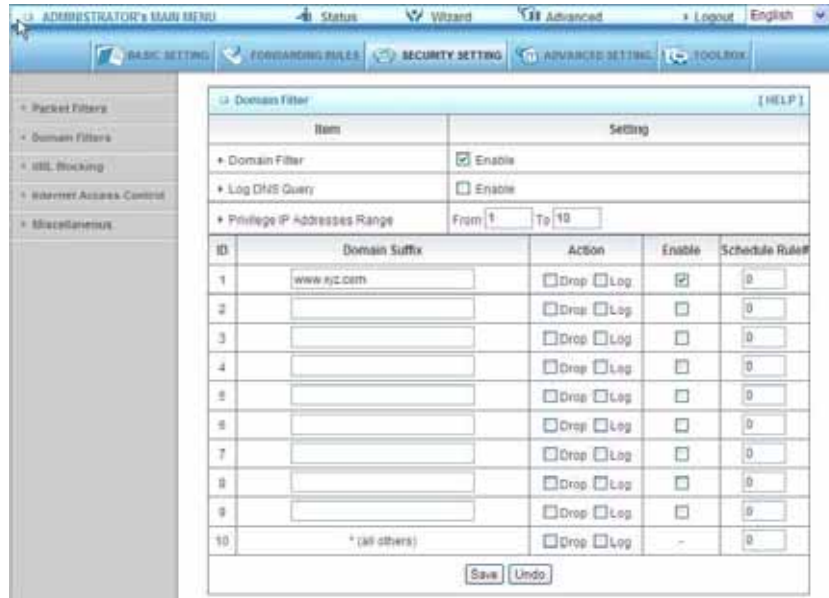

Buttons at the bottom: Save, Undo, Inbound Filter...

(192.168.12.100 and 192.168.12.119) Located Hosts can do everything except read net news (port 119) and transfer files via FTP (port 21)

Others are allowed

After Outbound Packet Filter setting is configured, click the save button.

3.3.3.2 Domain filters

ID	Domain Suffix	Action	Enable	Schedule Rule
1	www.abc.com	<input type="checkbox"/> Drop <input type="checkbox"/> Log	<input checked="" type="checkbox"/>	0
2		<input type="checkbox"/> Drop <input type="checkbox"/> Log	<input type="checkbox"/>	0
3		<input type="checkbox"/> Drop <input type="checkbox"/> Log	<input type="checkbox"/>	0
4		<input type="checkbox"/> Drop <input type="checkbox"/> Log	<input type="checkbox"/>	0
5		<input type="checkbox"/> Drop <input type="checkbox"/> Log	<input type="checkbox"/>	0
6		<input type="checkbox"/> Drop <input type="checkbox"/> Log	<input type="checkbox"/>	0
7		<input type="checkbox"/> Drop <input type="checkbox"/> Log	<input type="checkbox"/>	0
8		<input type="checkbox"/> Drop <input type="checkbox"/> Log	<input type="checkbox"/>	0
9		<input type="checkbox"/> Drop <input type="checkbox"/> Log	<input type="checkbox"/>	0
10	* (all others)	<input type="checkbox"/> Drop <input type="checkbox"/> Log	<input type="checkbox"/>	0

Domain Filter

Let you prevent users under this device from accessing specific URLs.

Domain Filter Enable

Check if you want to enable Domain Filter.

Log DNS Query

Check if you want to log the action when someone accesses the specific URLs.

Privilege IP Addresses Range

Setting a group of hosts and privilege these hosts to access network without restriction.

Domain Suffix

A suffix of URL to be restricted. For example, ".com", "xxx.com".

Action

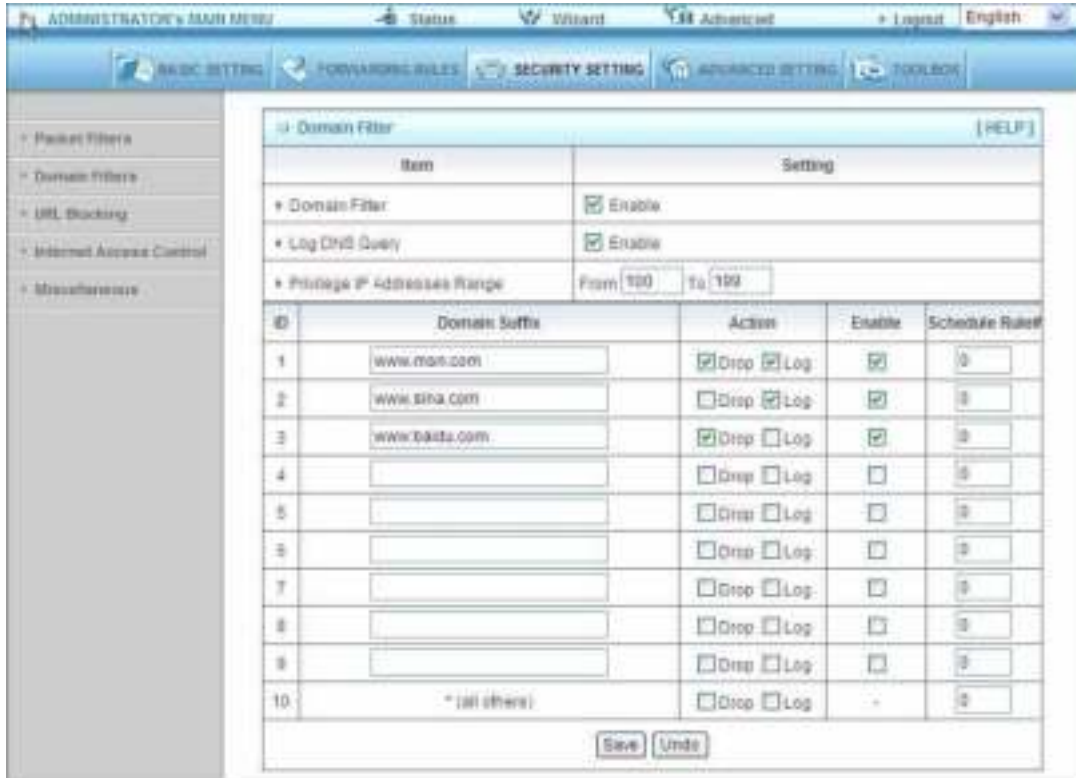

When someone is accessing the URL met the domain-suffix, what kind of action you want.

Check drop to block the access. Check log to log these access.

Enable

Check to enable each rule.

Example:

Item	Setting
Domain Filter	<input checked="" type="checkbox"/> Enable
Log DNS Query	<input checked="" type="checkbox"/> Enable
Privilege IP Addresses Range	From 100 To 100

ID	Domain Suffix	Action	Enable	Schedule Rule
1	www.msn.com	<input checked="" type="checkbox"/> Drop <input checked="" type="checkbox"/> Log	<input checked="" type="checkbox"/>	0
2	www.sina.com	<input type="checkbox"/> Drop <input checked="" type="checkbox"/> Log	<input checked="" type="checkbox"/>	0
3	www.baidu.com	<input checked="" type="checkbox"/> Drop <input type="checkbox"/> Log	<input checked="" type="checkbox"/>	0
4		<input type="checkbox"/> Drop <input type="checkbox"/> Log	<input type="checkbox"/>	0
5		<input type="checkbox"/> Drop <input type="checkbox"/> Log	<input type="checkbox"/>	0
6		<input type="checkbox"/> Drop <input type="checkbox"/> Log	<input type="checkbox"/>	0
7		<input type="checkbox"/> Drop <input type="checkbox"/> Log	<input type="checkbox"/>	0
8		<input type="checkbox"/> Drop <input type="checkbox"/> Log	<input type="checkbox"/>	0
9		<input type="checkbox"/> Drop <input type="checkbox"/> Log	<input type="checkbox"/>	0
10	* (all others)	<input type="checkbox"/> Drop <input type="checkbox"/> Log	<input type="checkbox"/>	0

In this example:

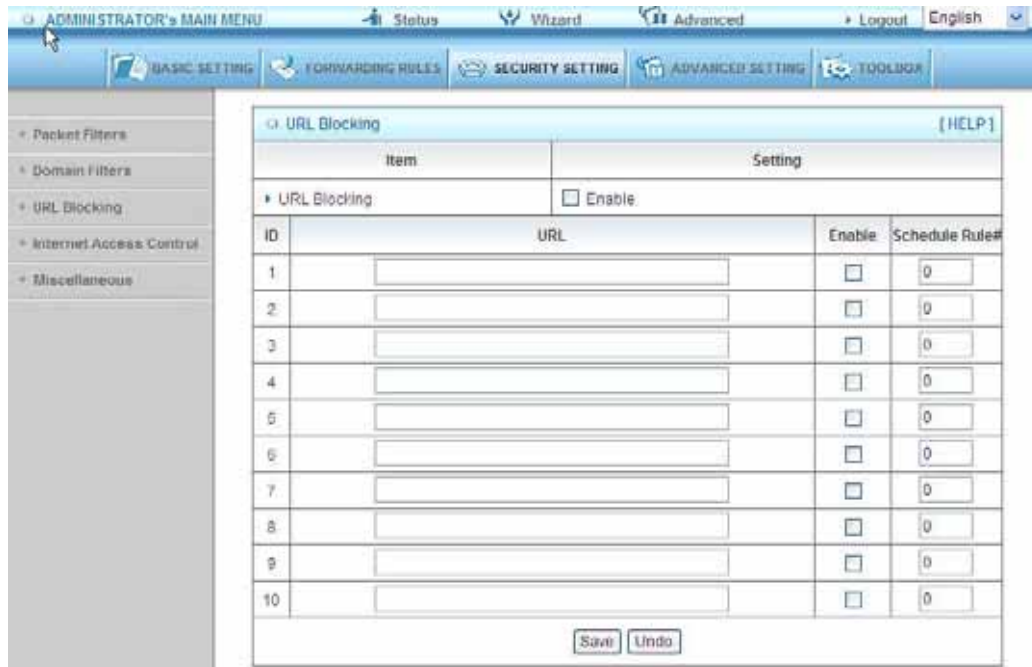

URL include "www.msn.com" will be blocked, and the action will be record in log-file.

URL include "www.sina.com" will not be blocked, but the action will be record in log-file.

URL include "www.baidu.com" will be blocked, but the action will not be record in log-file.

IP address x.x.x.1~x.x.x.99 can access Internet without restriction.

3.3.3.3 URL Blocking

ID	URL	Enable	Schedule Rule#
1		<input type="checkbox"/>	0
2		<input type="checkbox"/>	0
3		<input type="checkbox"/>	0
4		<input type="checkbox"/>	0
5		<input type="checkbox"/>	0
6		<input type="checkbox"/>	0
7		<input type="checkbox"/>	0
8		<input type="checkbox"/>	0
9		<input type="checkbox"/>	0
10		<input type="checkbox"/>	0

URL Blocking will block LAN computers to connect to pre-defined Websites.

The major difference between “Domain filter” and “URL Blocking” is Domain filter require user to input suffix (like .com or .org, etc), while URL Blocking require user to input a keyword only. In other words, Domain filter can block specific website, while URL Blocking can block hundreds of websites by simply a keyword.

URL Blocking Enable

Checked if you want to enable URL Blocking.

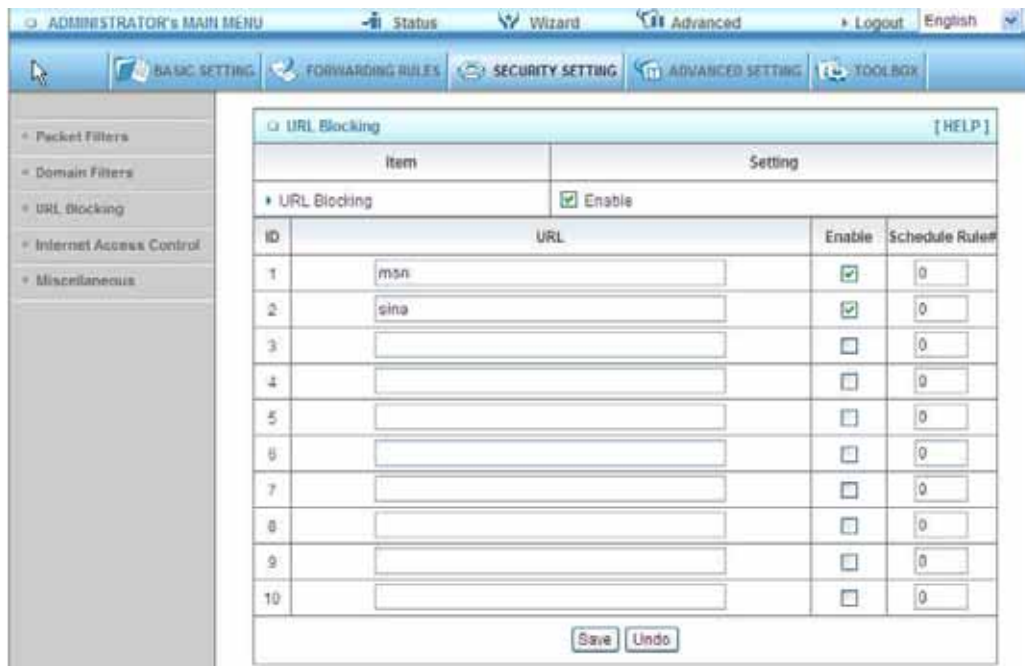

URL

If any part of the Website's URL matches the pre-defined word, the connection will be blocked.

For example, you can use pre-defined word "sex" to block all websites if their URLs contain pre-defined word "sex".

Enable

Checked to enable each rule.

ID	URL	Enable	Schedule Rule
1	msn	<input checked="" type="checkbox"/>	0
2	sina	<input checked="" type="checkbox"/>	0
3		<input type="checkbox"/>	0
4		<input type="checkbox"/>	0
5		<input type="checkbox"/>	0
6		<input type="checkbox"/>	0
7		<input type="checkbox"/>	0
8		<input type="checkbox"/>	0
9		<input type="checkbox"/>	0
10		<input type="checkbox"/>	0

In this example:

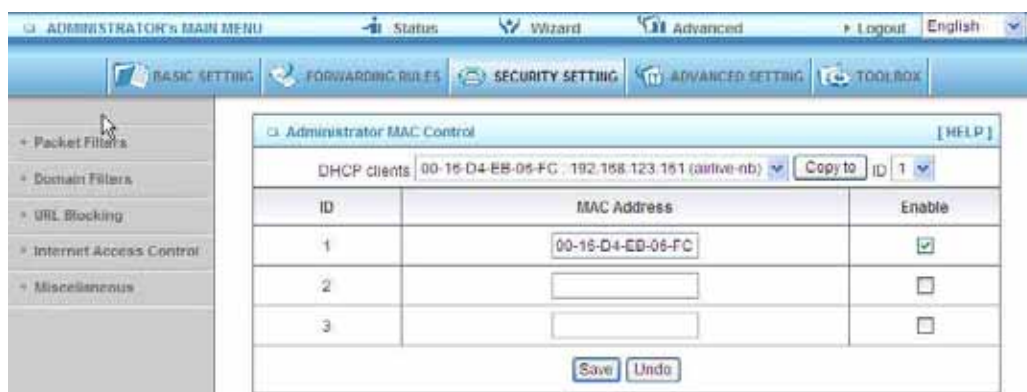

1. URL include "msn" will be blocked, and the action will be record in log-file.
2. URL include "sina" will be blocked, but the action will be record in log-file

3.3.3.4 Internet Access Control

The device provides "Administrator MAC Control" for specific MAC to access the device or Internet without restriction. It also provides 3 features to access Internet: MAC Control by host, Group MAC Control and Interface Access Control depend as user-defined time Schedule.

Administrator MAC Control

Regardless the MAC access configuration of administrator, specific MAC can access the device.

ID	MAC Address	Enable
1	00-16-D4-EB-06-FC	<input checked="" type="checkbox"/>
2		<input type="checkbox"/>
3		<input type="checkbox"/>

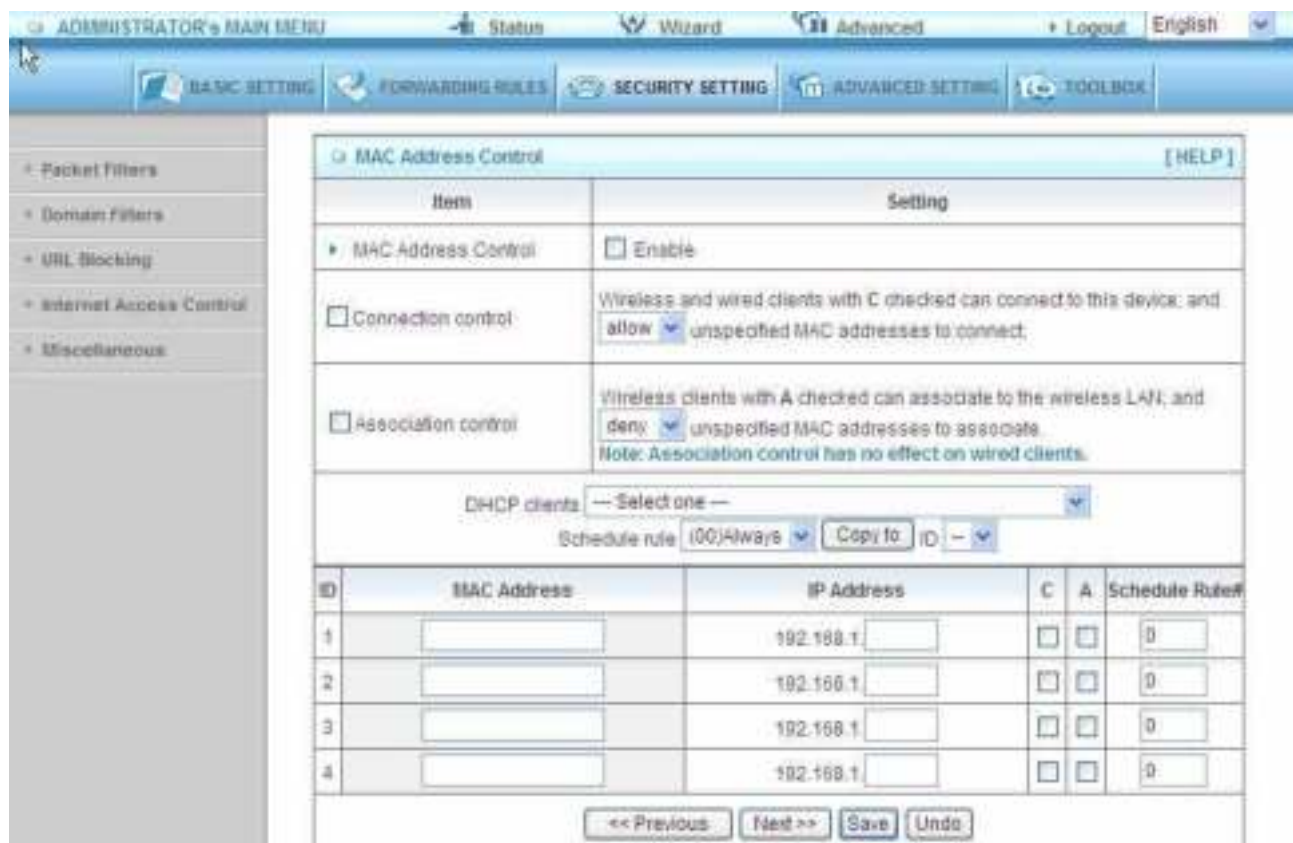

This device can record 3 sets. When the host(should be admin) logins Web management, the device will record MAC address of this host. Before this host configures Internet Access Control, Suggest end-user to enable this feature, first.

Item	Setting
Access Control Type	<input type="radio"/> MAC Access Control <input type="radio"/> Group MAC Access Control <input type="radio"/> Interface Access Control

2		192.168.1.	<input type="checkbox"/>	<input type="checkbox"/>	0
3		192.168.1.	<input type="checkbox"/>	<input type="checkbox"/>	0
4		192.168.1.	<input type="checkbox"/>	<input type="checkbox"/>	0

<< Previous | Next >> | Save | Undo

MAC Address Control allows you to assign different access right for different users and to assign a specific IP address to a certain MAC address.

MAC Address Control Check "Enable" to enable the "MAC Address Control". All of the settings in this page will take effect only when "Enable" is checked.

Connection control Check "Connection control" to enable the controlling of which wired and wireless clients can connect to this device. If a client is denied to connect to this device, it means the client can't access to the Internet either. Choose "allow" or "deny" to allow or

deny the clients, whose MAC addresses are not in the "Control table" (please see below), to connect to this device.

Association control Check "Association control" to enable the controlling of which wireless client can associate to the wireless LAN. If a client is denied to associate to the wireless LAN, it means the client can't send or receive any data via this device. Choose "allow" or "deny" to allow or deny the clients, whose MAC addresses are not in the "Control table", to associate to the wireless LAN.

Control table

ID	MAC Address	IP Address	C	A	Schedule Rule#
1	<input type="text"/>	192.168.1. <input type="text"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="text" value="0"/>
2	<input type="text"/>	192.168.1. <input type="text"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="text" value="0"/>
3	<input type="text"/>	192.168.1. <input type="text"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="text" value="0"/>
4	<input type="text"/>	192.168.1. <input type="text"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="text" value="0"/>

"Control table" is the table at the bottom of the "MAC Address Control" page. Each row of this table indicates the MAC address and the expected IP address mapping of a client.

There are four columns in this table:

MAC Address	MAC address indicates a specific client.
IP Address	Expected IP address of the corresponding client. Keep it empty if you don't care its IP address.
C	When "Connection control" is checked, check "C" will allow the corresponding client to connect to this device.
A	When "Association control" is checked, check "A" will allow the corresponding client to associate to the wireless LAN.

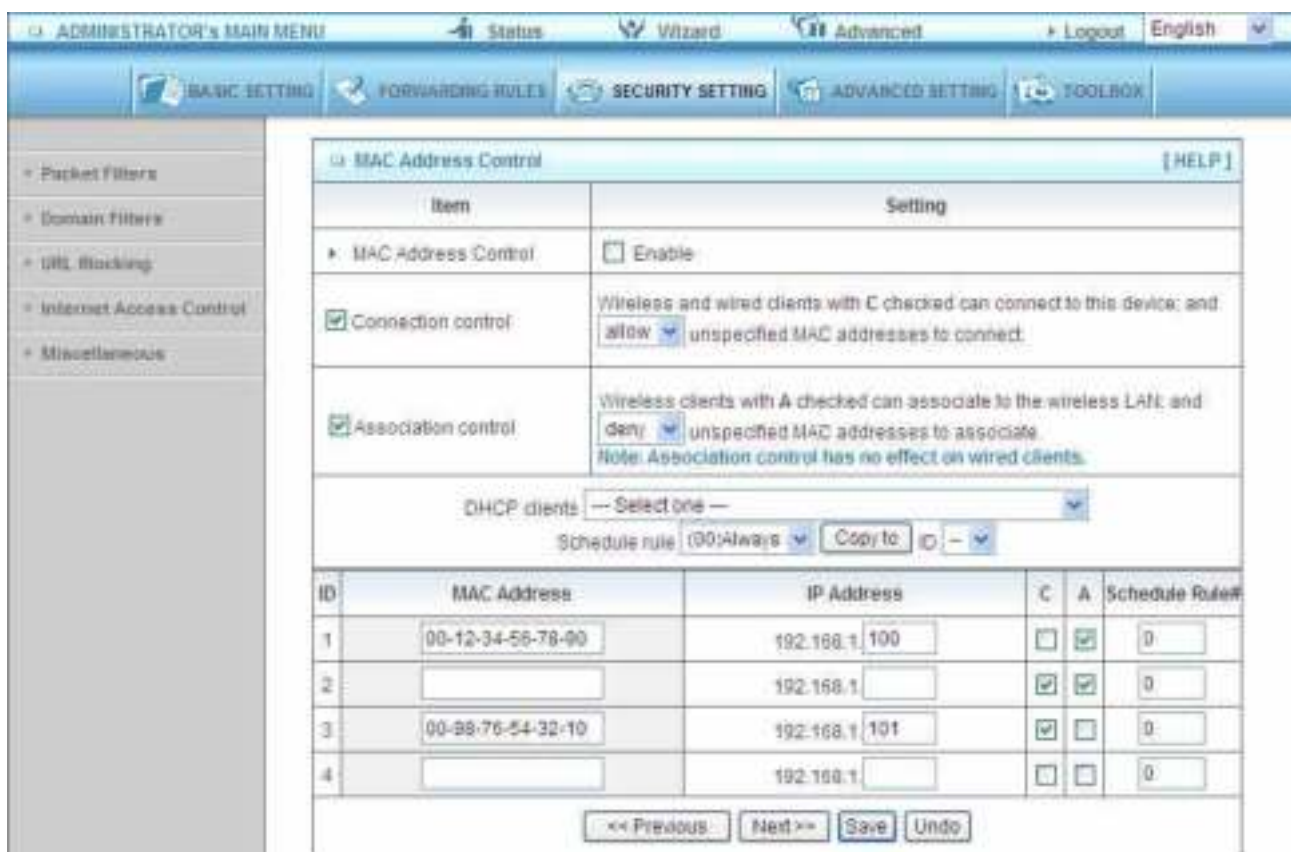

In this page, we provide the following Combobox and button to help you to input the MAC address.

You can select a specific client in the “DHCP clients” Combobox, and then click on the “Copy to” button to copy the MAC address of the client you select to the ID selected in the “ID” Combobox.

Previous page and Next Page To make this setup page simple and clear, we have divided the “Control table” into several pages. You can use these buttons to navigate to different pages.

Example:

ID	MAC Address	IP Address	C	A	Schedule Rule#
1	00-12-34-56-78-90	192.168.1.100	<input type="checkbox"/>	<input checked="" type="checkbox"/>	0
2		192.168.1.	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	0
3	00-88-76-54-32-10	192.168.1.101	<input checked="" type="checkbox"/>	<input type="checkbox"/>	0
4		192.168.1.	<input type="checkbox"/>	<input type="checkbox"/>	0

In this scenario, there are three clients listed in the Control Table. Clients 1 and 2 are wireless, and client 3 is wired.

- 1.The "MAC Address Control" function is enabled.
- 2."Connection control" is enabled, and all of the wired and wireless clients not listed in the "Control table" are "allowed" to connect to this device.

3."Association control" is enabled, and all of the wireless clients not listed in the "Control table" are "denied" to associate to the wireless LAN.

4.Clients 1 and 3 have fixed IP addresses either from the DHCP server of this device or manually assigned:

ID 1 - "00-12-34-56-78-90" --> 192.168.1.100

ID 3 - "00-98-76-54-32-10" --> 192.168.1.101

Client 2 will obtain its IP address from the IP Address pool specified in the "DHCP Server" page or can use a manually assigned static IP address.

If, for example, client 3 tries to use an IP address different from the address listed in the Control table (192.168.12.101), it will be denied to connect to this device.

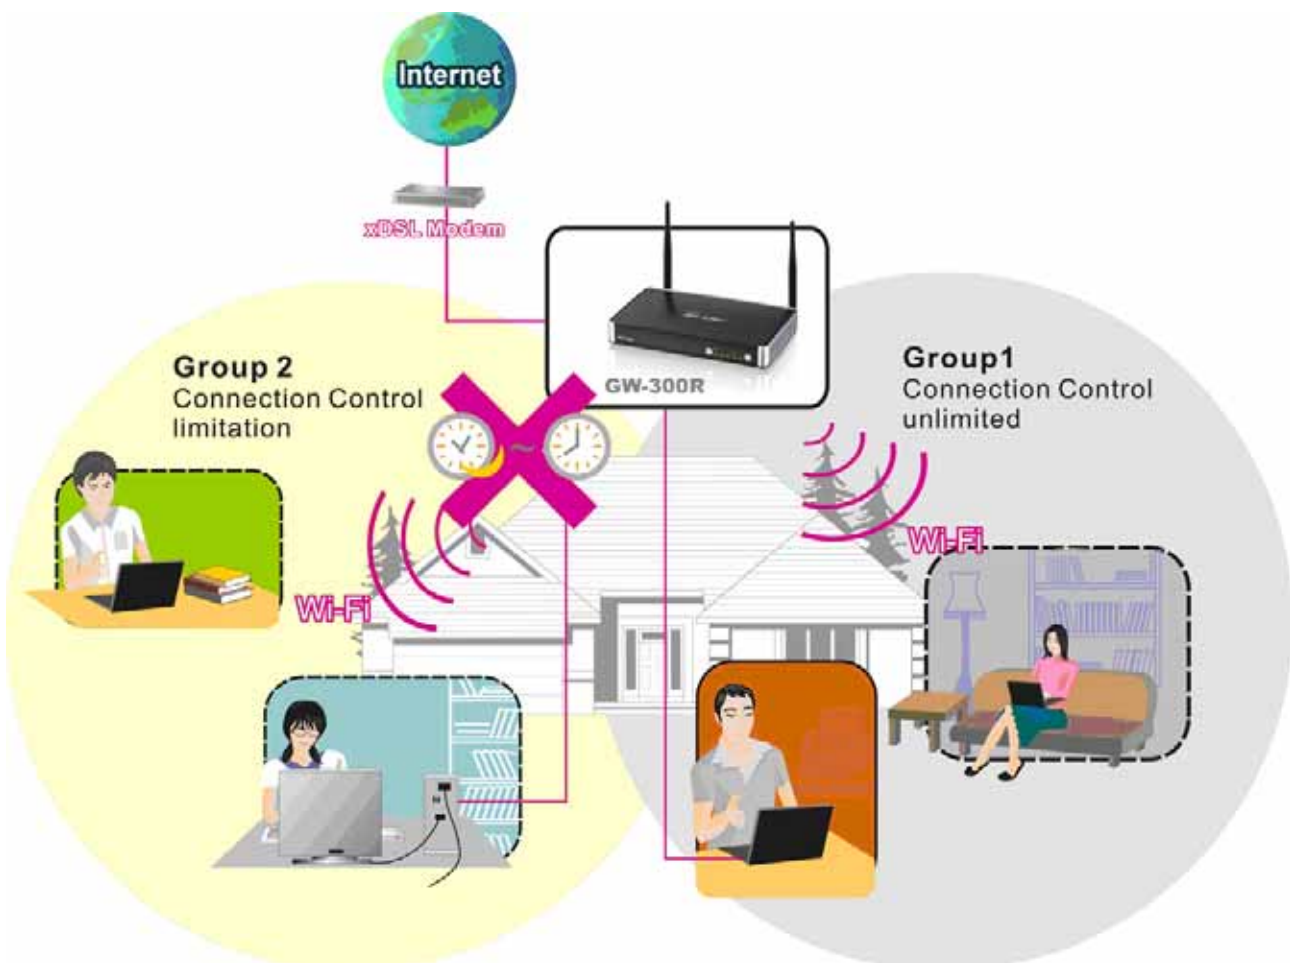

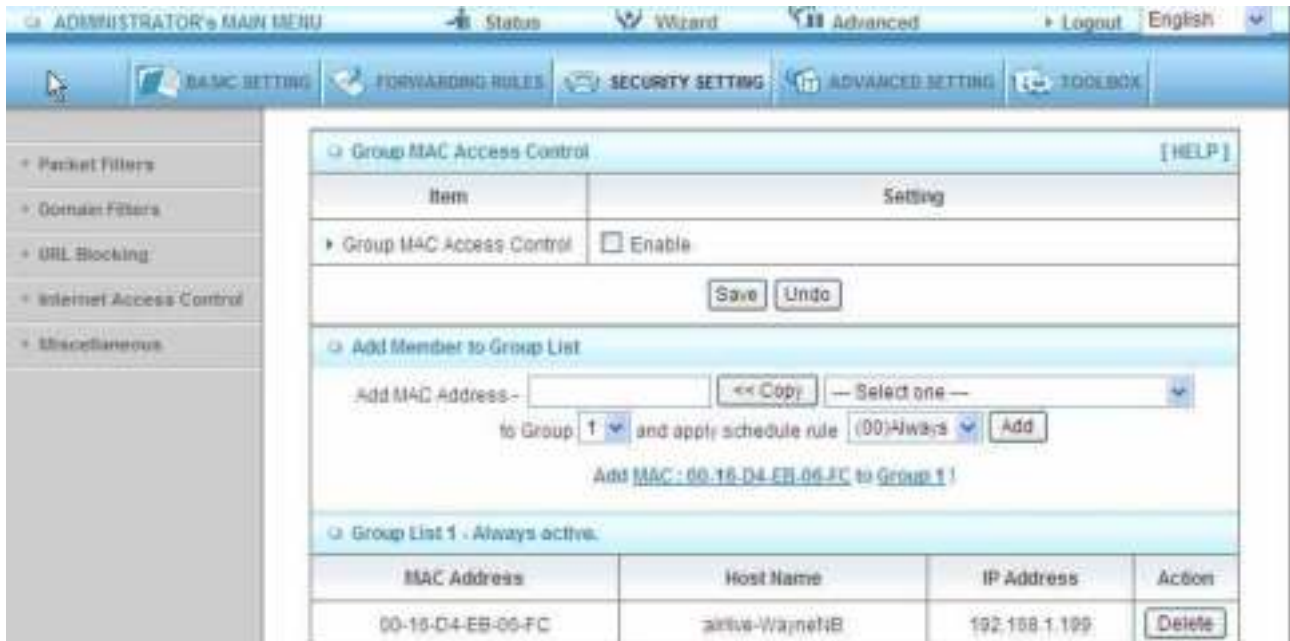

5.Clients 2 and 3 and other wired clients with a MAC address unspecified in the Control table are all allowed to connect to this device. But client 1 is denied to connect to this device.

6.Clients 1 and 2 are allowed to associate to the wireless LAN, but a wireless client with a MAC address not specified in the Control table is denied to associate to the wireless LAN. Client 3 is a wired client and so is not affected by Association control.

Group MAC Access Control

Administrator can define hosts in which Group to allow Internet. For example, Father and Mother are in Group1 without limitation and hosts Brother and Sister are in Group2 to access according as Schedule Rule2.

For example,
Schedule Rule 1 sets “always” everyday with limitation.

Interface Access Control

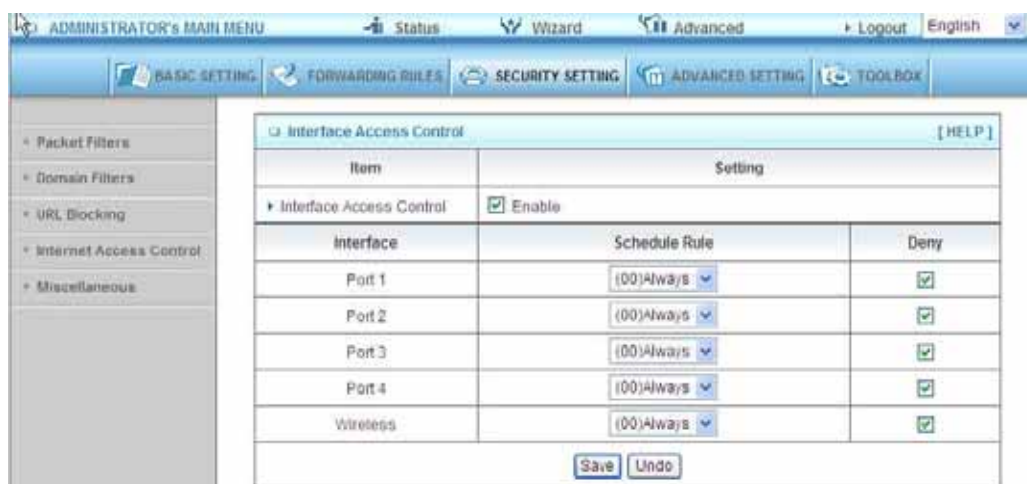

The device defines 5 Interfaces as Lan1,Lan2, Lan3,Lan4 and WiFi. The device allows different interface to access Internet by time schedule

For example, Schedule Rule 1 sets “always” everyday with limitation.

Schedule Rule 2 sets 08:00~23:00 Monday ~ Friday.

Administrator can set guests in Lan3 and Lan4 to access Internet according as Schedule Rule

2. Set Friends in Lan1 ,Lan2 and WiFi according as Schedule Rule 1.

3.3.3.5 Miscellaneous Items

Item	Setting	Enable
Remote Administrator Host / Port	0.0.0.0 / 88	<input type="checkbox"/>
Administrator Time-out	600 seconds (0 to disable)	
Discard Ping from WAN side		<input type="checkbox"/>
SPI mode		<input type="checkbox"/>
DoS Attack Detection		<input type="checkbox"/>
VPN PPTP Pass-Through		<input checked="" type="checkbox"/>
VPN IPSec Pass-Through		<input checked="" type="checkbox"/>

Remote Administrator Host/Port

In general, only Intranet user can browse the built-in web pages to perform administration task. This feature enables you to perform administration task from remote host. If this feature is enabled, only the specified IP address can perform remote administration. If the specified IP address is 0.0.0.0, any host can connect to this product to perform administration task. You can use subnet mask bits "/nn" notation to specified a group of trusted IP addresses. For example, "10.1.2.0/24".

NOTE: When Remote Administration is enabled, the web server port will be shifted to 88. You can change web server port to other port, too.

Administrator Time-out

The time of no activity to logout automatically. Set it to zero to disable this feature.

Discard PING from WAN side

When this feature is enabled, any host on the WAN cannot ping this product.

SPI Mode

When this feature is enabled, the router will record the packet information pass through the router like IP address, port address, ACK, SEQ number and so on. And the router will check every incoming packet to detect if this packet is valid.

DoS Attack Detection

When this feature is enabled, the router will detect and log the DoS attack comes from the Internet. Currently, the router can detect the following DoS attack: SYN Attack, WinNuke, Port Scan, Ping of Death, Land Attack etc.

VPN IPSec Pass-Through

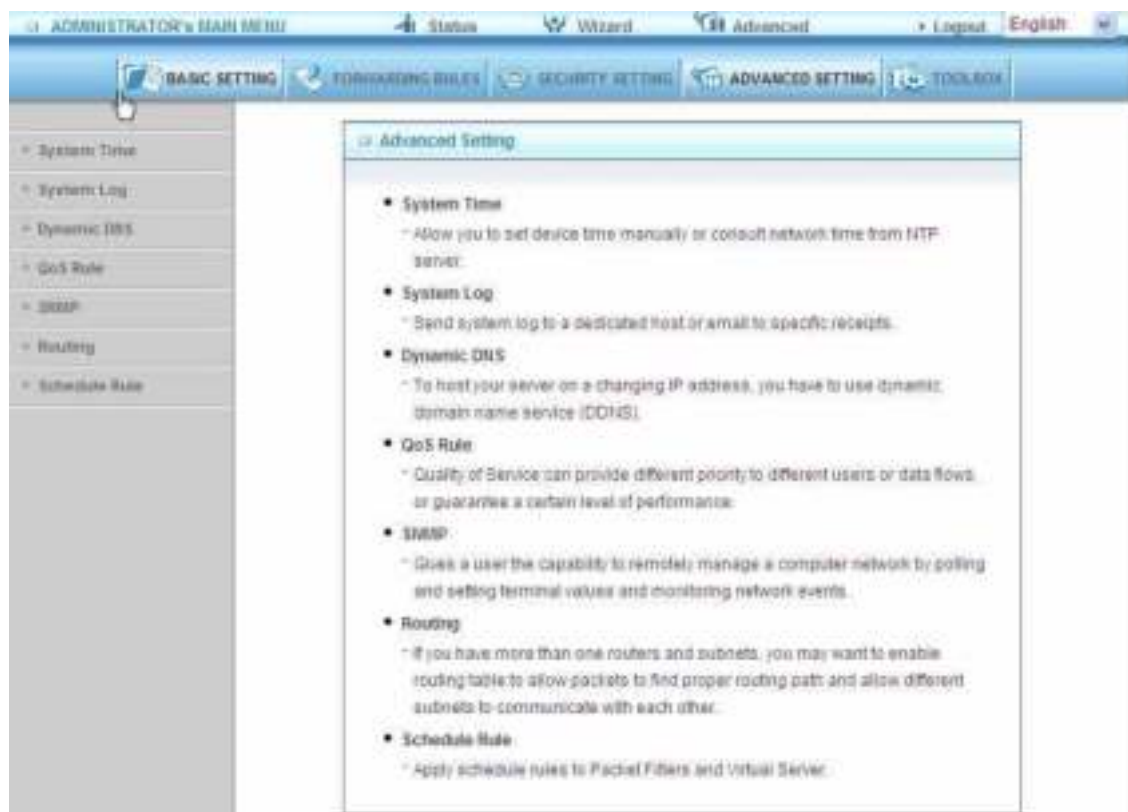

It is a setting/feature on routers which is required to implement secure exchange of packets at

the IP layer and allow IPSec tunnels to pass through the router.

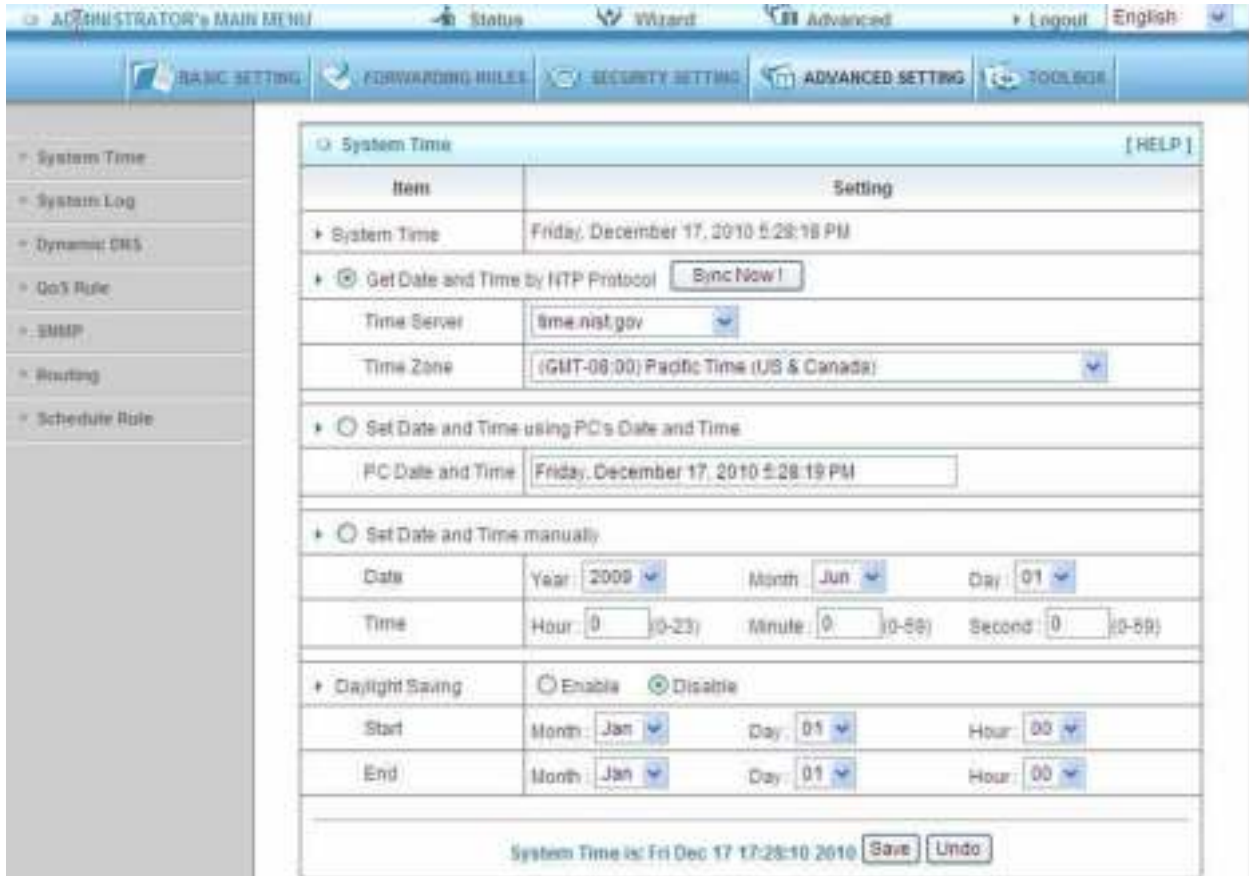

VPN PPTP Pass-Through

It is a setting/feature on routers which is required in order to connect to a Remote PPTP VPN account.

Log Type	<input checked="" type="checkbox"/> System Activity <input checked="" type="checkbox"/> Debug Information <input checked="" type="checkbox"/> Attacks <input checked="" type="checkbox"/> Dropped Packets <input checked="" type="checkbox"/> Notice	

View Log Save Undo

This page support two methods to export system logs to specific destination by means of syslog(UDP) and SMTP(TCP). The items you have to setup including:

IP Address for Syslog

Host IP of destination where syslogs will be sent to.

Check Enable to enable this function.

E-mail Alert Enable

Check if you want to enable Email alert (send syslog via email).

SMTP Server IP and Port

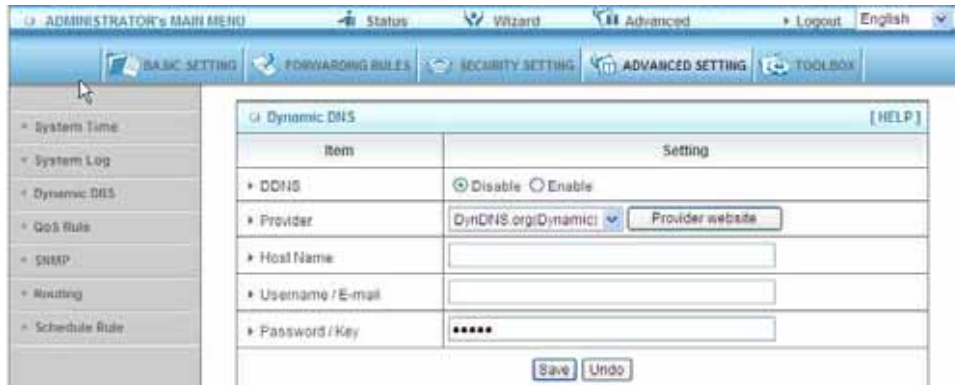

Input the SMTP server IP and port, which are concated with ':'. If you do not specify port number, the default value is 25.

For example, "mail.your_url.com" or "192.168.1.100:26".

Send E-mail alert to

The recipients who will receive these logs. You can assign more than 1 recipient, using ';' or ',' to separate these email addresses.

3.3.4.3 DDNS Service

To host your server on a changing IP address, you have to use dynamic domain name service (DDNS).

So that anyone wishing to reach your host only needs to know the name of it. Dynamic DNS will map the name of your host to your current IP address, which changes each time you connect your Internet service provider.

Before you enable Dynamic DNS, you need to register an account on one of these Dynamic DNS servers that we list in provider field.

To enable Dynamic DNS click the check box next to Enable in the DDNS field.

Next you can enter the appropriate information about your Dynamic DNS Server.

You have to define:

Provider

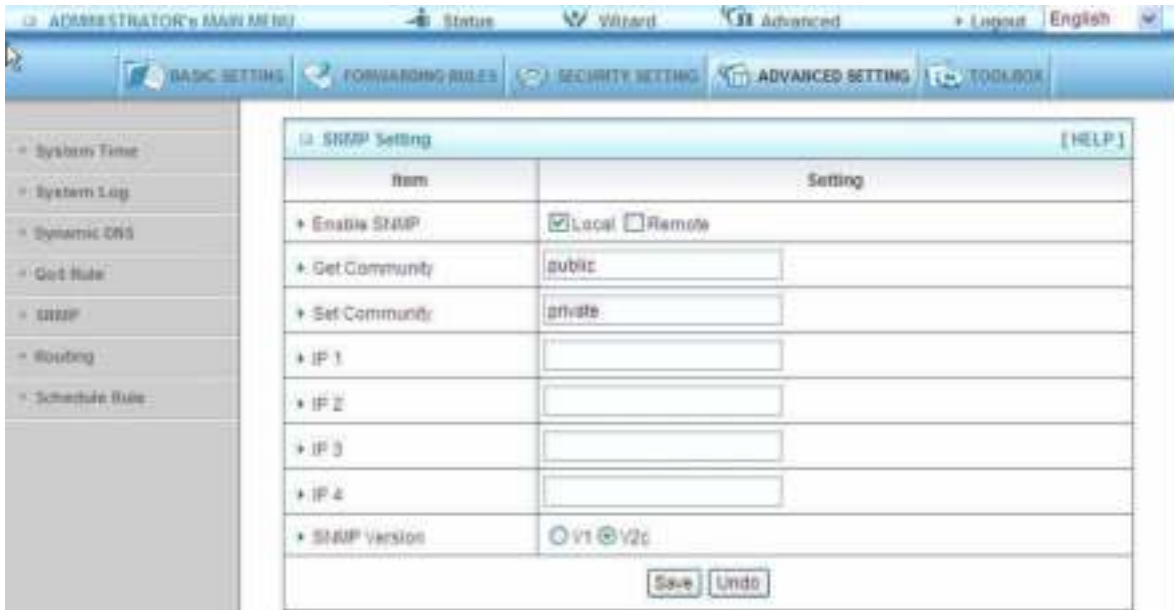

Host Name

Username/E-mail

Password/Key

You will get this information when you register an account on a Dynamic DNS server.

3.3.4.4 SNMP

Item	Setting
Enable SNMP	<input checked="" type="checkbox"/> Local <input type="checkbox"/> Remote
Get Community	public
Set Community	private
IP 1	
IP 2	
IP 3	
IP 4	
SNMP Version	<input type="radio"/> V1 <input checked="" type="radio"/> V2c

Save Undo

In brief, SNMP, the Simple Network Management Protocol, is a protocol designed to give a user the capability to remotely manage a computer network by polling and setting terminal values and monitoring network events.

Enable SNMP

You must check Local, Remote or both to enable SNMP function. If Local is checked, this device will response request from LAN. If Remote is checked, this device will response request from WAN.

Get Community

Setting the community of GetRequest your device will response.

Set Community

Setting the community of SetRequest your device will accept.

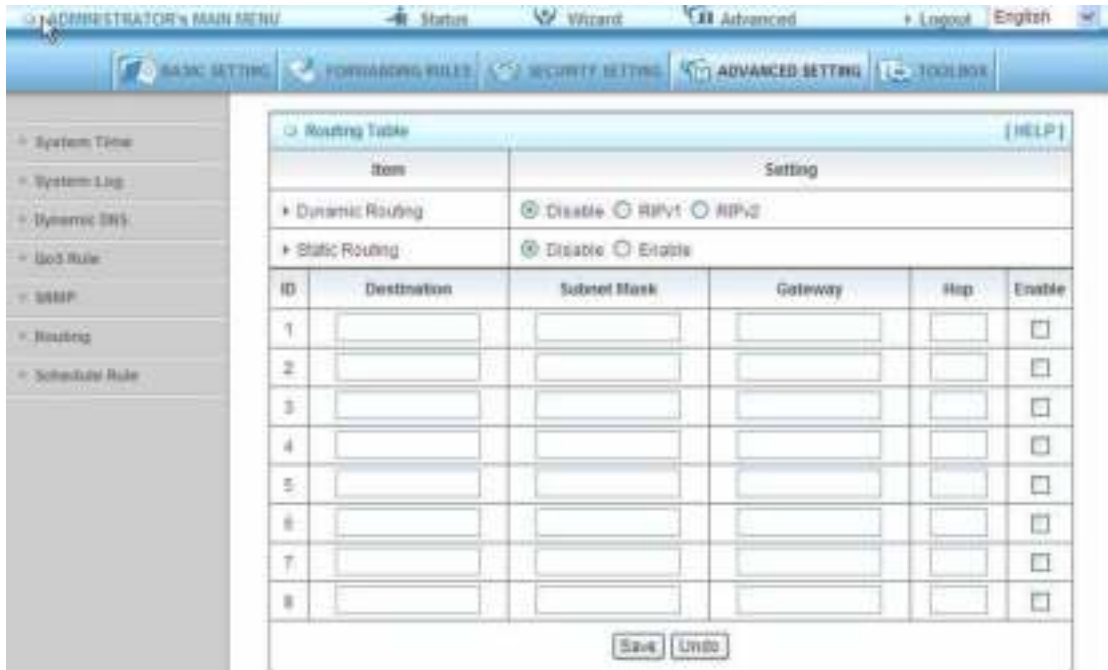

IP 1, IP 2, IP 3, IP 4

Input your SNMP Management PC's IP here. User has to configure to where this device should send SNMP Trap message.

SNMP Version

Please select proper SNMP Version that your SNMP Management software supports.

3.3.4.5 Routing

The screenshot shows the 'ADMINISTRATOR'S MAIN MENU' with tabs for BASIC SETTING, FORWARDING RULES, SECURITY SETTING, ADVANCED SETTING, and TOOLBOX. The 'ADVANCED SETTING' tab is selected, and the 'Routing Table' sub-tab is active. The interface includes a sidebar with navigation options like System Time, System Log, Dynamic DNS, QoS Rule, SNMP, Routing, and Schedule Rule. The main content area displays the 'Routing Table' configuration with sections for Dynamic Routing and Static Routing, and a table for adding routing rules.

Routing Table [HELP]					
Item		Setting			
Dynamic Routing		<input checked="" type="radio"/> Disable <input type="radio"/> RIPv1 <input type="radio"/> RIPv2			
Static Routing		<input checked="" type="radio"/> Disable <input type="radio"/> Enable			
ID	Destination	Subnet Mask	Gateway	Hop	Enable
1					<input type="checkbox"/>
2					<input type="checkbox"/>
3					<input type="checkbox"/>
4					<input type="checkbox"/>
5					<input type="checkbox"/>
6					<input type="checkbox"/>
7					<input type="checkbox"/>
8					<input type="checkbox"/>

Buttons: Save, Undo

Routing Tables allow you to determine which physical interface address to use for outgoing IP data grams. If you have more than one routers and subnets, you will need to enable routing table to allow packets to find proper routing path and allow different subnets to communicate with each other.

Routing Table settings are settings used to setup the functions of static.

Dynamic Routing

Routing Information Protocol (RIP) will exchange information about destinations for computing routes throughout the network. Please select RIPv2 only if you have different subnet in your network.

Otherwise, please select RIPv1 if you need this protocol.

Static Routing: For static routing, you can specify up to 8 routing rules. You can enter the destination IP address, subnet mask, gateway, hop for each routing rule, and then enable or disable the rule by checking or unchecking the Enable checkbox.

Example:

Configuration on NAT Router

Destination	SubnetMask	Gateway	Hop	Enabled
192.168.3.0	255.255.255.0	192.168.1.216	1	✓
192.168.0.0	255.255.255.0	192.168.1.103	1	✓

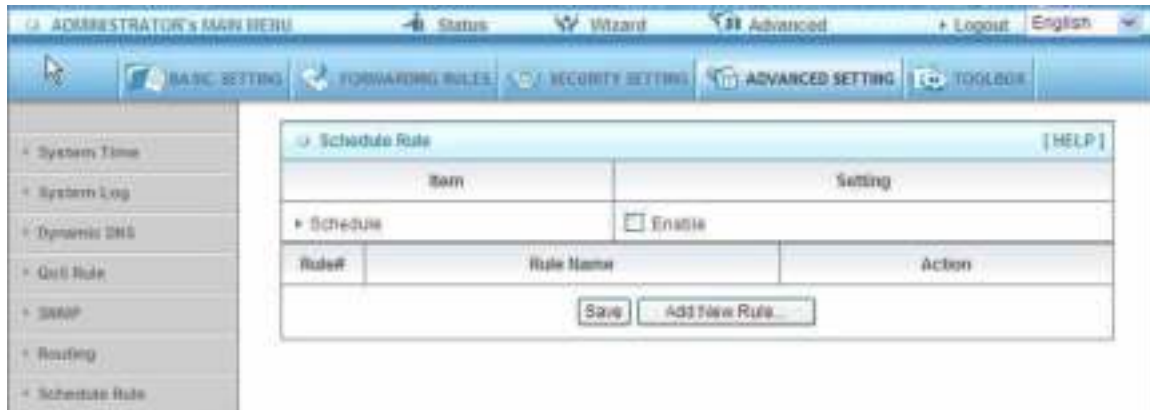

So if, for example, the client3 wanted to send an IP data gram to 192.168.0.2, it would use the above table to determine that it had to go via 192.168.1.103 (a gateway),

And if it sends Packets to 192.168.3.11 will go via 192.168.1.216

Each rule can be enabled or disabled individually.

After routing table setting is configured, click the save button.

3.3.4.6 Schedule Rule

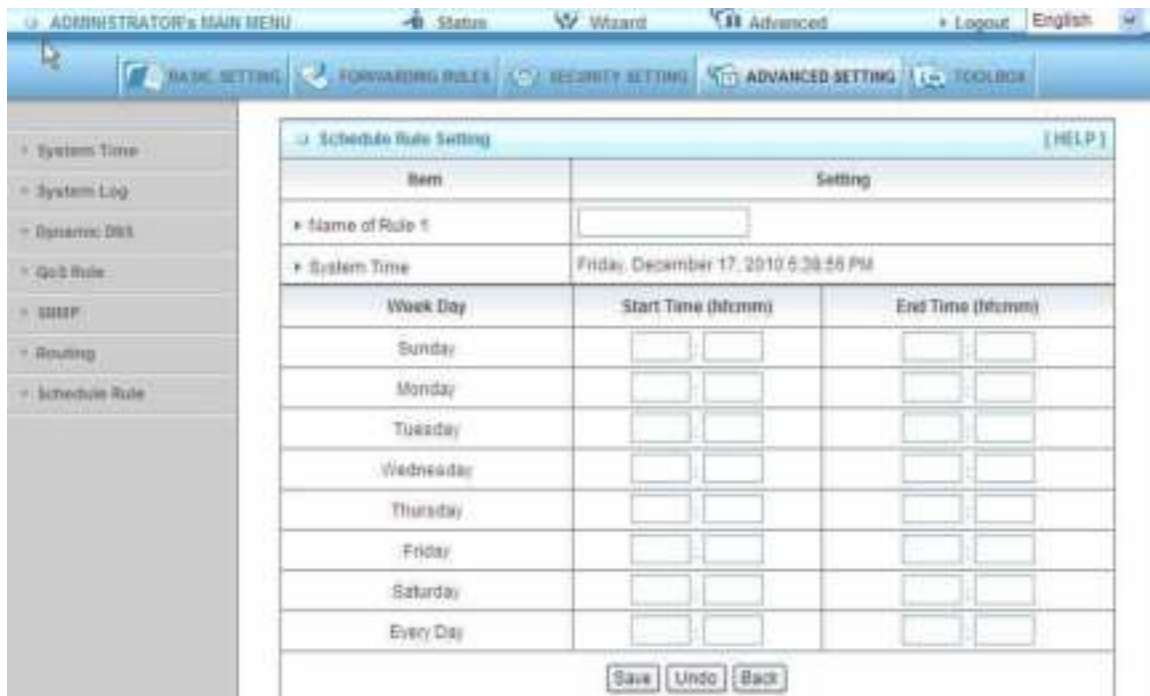

Item	Setting	
Schedule	<input type="checkbox"/> Enable	
Rule#	Rule Name	Action
<input type="button" value="Save"/> <input type="button" value="Add New Rule..."/>		

You can set the schedule time to decide which service will be turned on or off. Select the “enable” item.

Press “Add New Rule”

You can write a rule name and set which day and what time to schedule from “Start Time” to “End Time”. The following example configure “ftp time” as everyday 14:10 to 16:20

Item	Setting	
Name of Rule 1	<input type="text"/>	
System Time	Friday, December 17, 2010 5:28:56 PM	
Week Day	Start Time (hh:mm)	End Time (hh:mm)
Sunday	<input type="text"/>	<input type="text"/>
Monday	<input type="text"/>	<input type="text"/>
Tuesday	<input type="text"/>	<input type="text"/>
Wednesday	<input type="text"/>	<input type="text"/>
Thursday	<input type="text"/>	<input type="text"/>
Friday	<input type="text"/>	<input type="text"/>
Saturday	<input type="text"/>	<input type="text"/>
Every Day	<input type="text"/>	<input type="text"/>
<input type="button" value="Save"/> <input type="button" value="Undo"/> <input type="button" value="Back"/>		

Schedule Enable

Selected if you want to Enable the Scheduler.

Edit

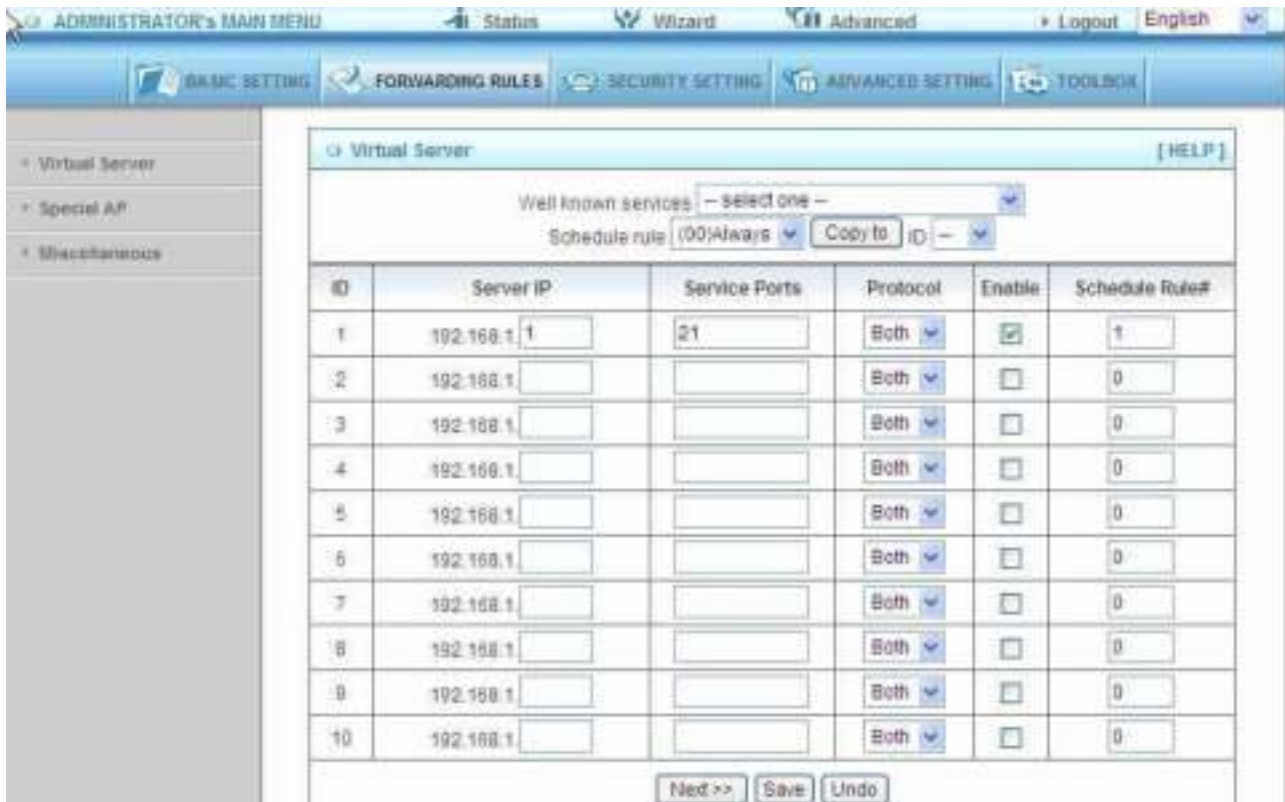

To edit the schedule rule.

Delete

To delete the schedule rule, and the rule# of the rules behind the deleted one will decrease one automatically.

Schedule Rule can be apply to Virtual server and Packet Filter, for example:

Exanple1: Virtual Server – Apply Rule#1 (ftp time: everyday 14:20 to 16:30)

ADMINISTRATOR'S MAIN MENU | Status | Wizard | Advanced | Logout | English

Please input Client IP,ex192.168.1.161.

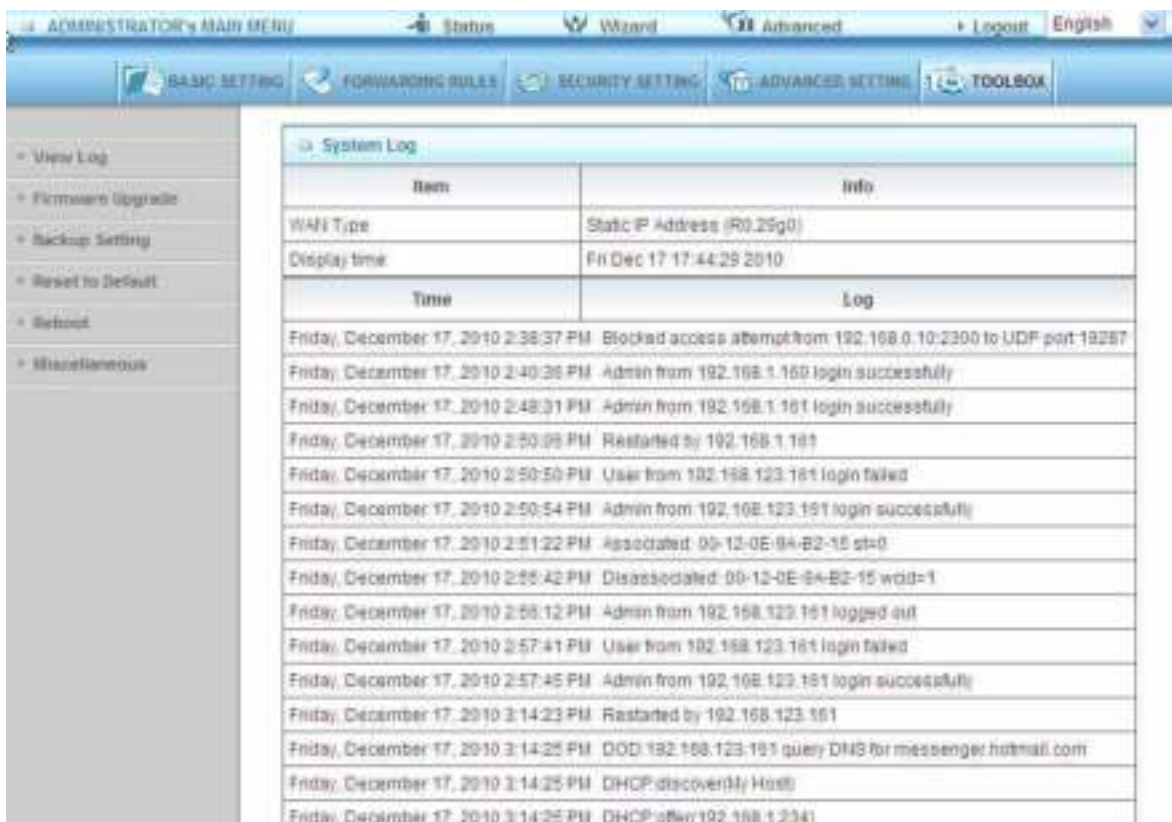

Remote Priority:

Please input Global IP and port,ex:168.96.2.3 and port 21

3.3.5 Toolbox

3.3.5.1 View Log

You can View system log by clicking the View Log button

3.3.5.2 Firmware Upgrade

You can upgrade firmware by clicking Firmware Upgrade button.

3.3.5.3 Backup Setting

You can backup your settings by clicking the Backup Setting button and save it as a bin file. Once you want to restore these settings, please click Firmware Upgrade button and use the bin file you saved.

3.3.5.4 Reset to default

You can also reset this product to factory default by clicking the Reset to default button.

3.3.5.5 Reboot

You can also reboot this product by clicking the Reboot button.

3.3.5.6 Miscellaneous Items

MAC Address for Wake-on-LAN

Wake-on-LAN is a technology that enables you to power up a networked device remotely. In order to enjoy this feature, the target device must be Wake-on-LAN enabled and you have to know the MAC address of this device, say 00-11-22-33-44-55. Clicking "Wake up" button will make the router to send the wake-up frame to the target device immediately.

Domain Name or IP Address for Test

Allow you to configure an IP, and ping the device. You can ping a specific IP to test whether it is alive.

Appendices and Index

802.1x Setting

1 Equipment Details

Figure 1: Testing Environment (Use Windows 2000 Radius Server)

PC1:

Microsoft Windows XP Professional without Service Pack 1.

AirLive WN-200USB

Driver version:

PC2:

Microsoft Windows XP Professional with Service Pack 1a or latter.

AirLive WN-200USB

Driver version: 1.7.29.0 (Driver date: 10.20.2001)

Authentication Server: Windows 2000 RADIUS server with Service Pack 3 and HotFix Q313664.

Note. Windows 2000 RADIUS server only supports PEAP after upgrade to service pack 3 and

HotFix Q313664 (You can get more information from

HH<http://support.microsoft.com/default.aspx?scid=kb;en-us;313664>HH)

2 DUT

Configuration:

Enable DHCP server.

WAN setting: static IP address.

LAN IP address: 192.168.1.254/24.

Set RADIUS server IP.

Set RADIUS server shared key.

Configure WEP key and 802.1X setting.

The following test will use the inbuilt 802.1X authentication method such as ,EAP_TLS, PEAP_CHAPv2(Windows XP with SP1 only), and PEAP_TLS(Windows XP with SP1 only) using the Smart Card or other Certificate of the Windows XP Professional.

3. DUT and Windows 2000 Radius Server Setup

Setup Windows 2000 RADIUS Server

We have to change authentication method to MD5_Challenge or using smart card or other certificate on RADIUS server according to the test condition.

Setup DUT

Enable the 802.1X (check the “Enable checkbox”).

Enter the RADIUS server IP.

Enter the shared key. (The key shared by the RADIUS server and DUT).

We will change 802.1X encryption key length to fit the variable test condition.

Setup Network adapter on PC

1.Choose the IEEE802.1X as the authentication method. (Fig 2)

Note.

Figure 2 is a setting picture of Windows XP without service pack 1. If users upgrade to service pack 1, then they can't see MD5-Challenge from EAP type list any more, but they will get a new Protected EAP (PEAP) option.

Choose MD5-Challenge or Smart Card or other Certificate as the EAP type.

3.If choosing use smart card or the certificate as the EAP type, we select to use a certificate on this computer. (Fig 3)

4. We will change EAP type to fit the variable test condition.

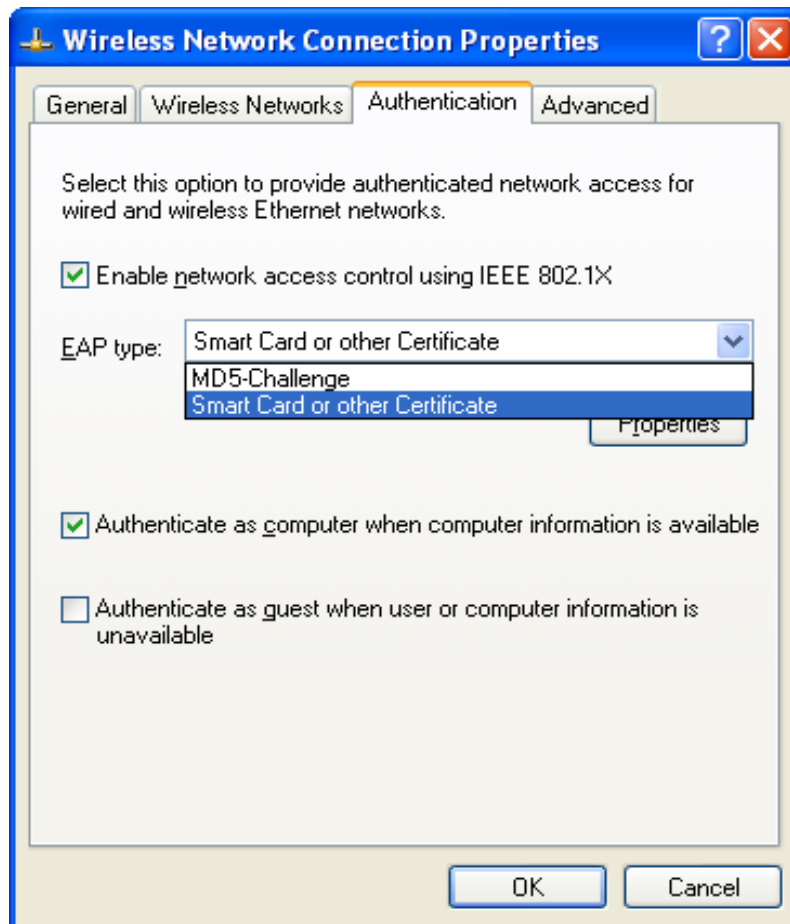

Figure 2: Enable IEEE 802.1X access control

Figure 3: Smart card or certificate properties

4. Windows 2000 RADIUS server Authentication testing:

4.1 DUT authenticate PC1 using certificate. (PC2 follows the same test procedures.)

Download and install the certificate on PC1. (Fig 4)

PC1 choose the SSID of DUT as the Access Point.

Set authentication type of wireless client and RADIUS server both to EAP_TLS.

Disable the wireless connection and enable again.

The DUT will send the user's certificate to the RADIUS server, and then send the message of authentication result to PC1. (Fig 5)

Windows XP will prompt that the authentication process is success or fail and end the authentication procedure. (Fig 6)

Terminate the test steps when PC1 get dynamic IP and PING remote host successfully.

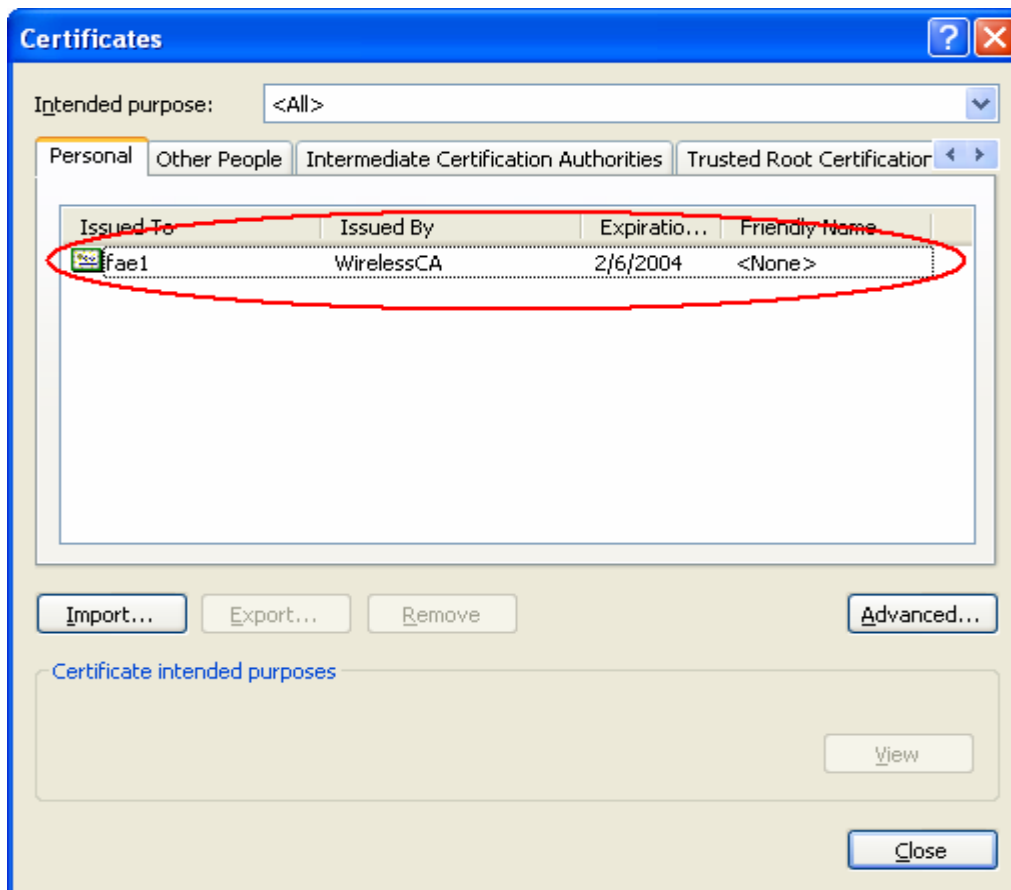

Figure 4: Certificate information on PC1

Figure 5: Authenticating

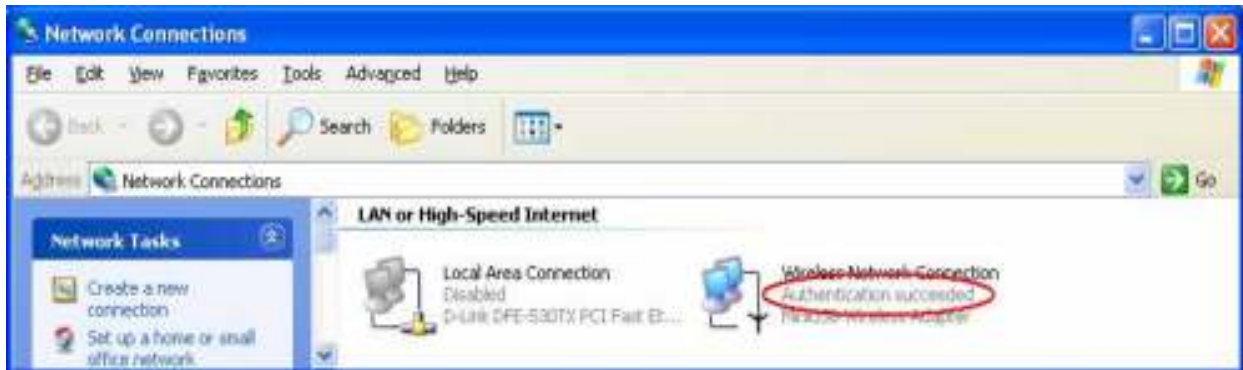

Figure 6: Authentication success

4.2 DUT authenticate PC2 using PEAP-TLS.

PC2 choose the SSID of DUT as the Access Point.

Set authentication type of wireless client and RADIUS server both to PEAP_TLS.

Disable the wireless connection and enable again.

The DUT will send the user's certificate to the RADIUS server, and then send the message of authentication result to PC2.

Windows XP will prompt that the authentication process is success or fail and end the authentication procedure.

Terminate the test steps when PC2 get dynamic IP and PING remote host successfully.

Support Type: The router supports the types of 802.1x Authentication:
PEAP-CHAPv2 and PEAP-TLS.

Note.

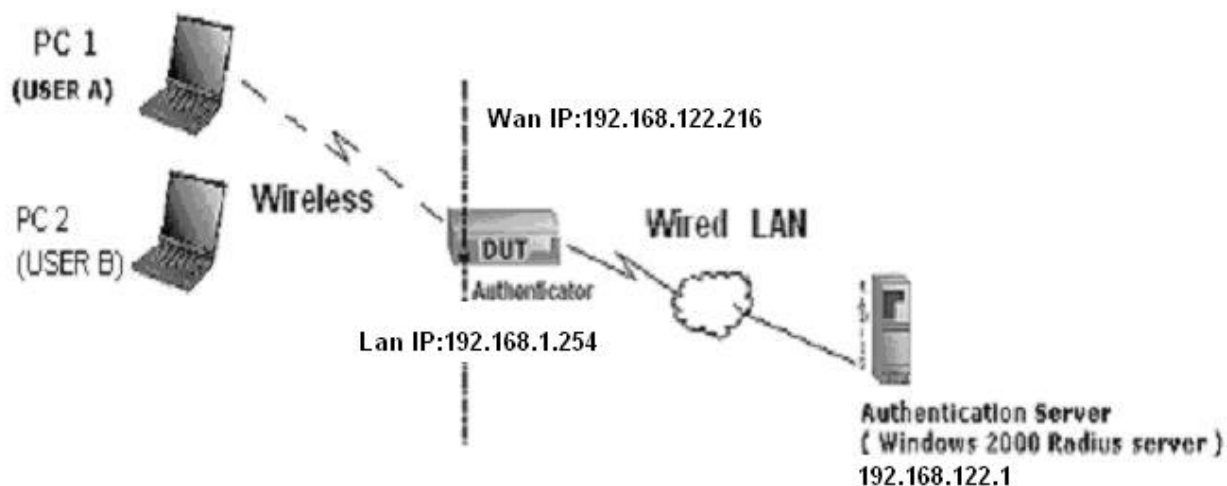

PC1 is on Windows XP platform without Service Pack 1.

PC2 is on Windows XP platform with Service Pack 1a.

PEAP is supported on Windows XP with Service Pack 1 only.

Windows XP with Service Pack 1 allows 802.1x authentication only when data encryption function is enable.

WPA Settings

Wireless Router: LAN IP: 192.168.1.254

WAN IP: 192.168.122.216

Radius Server: 192.168.122.1

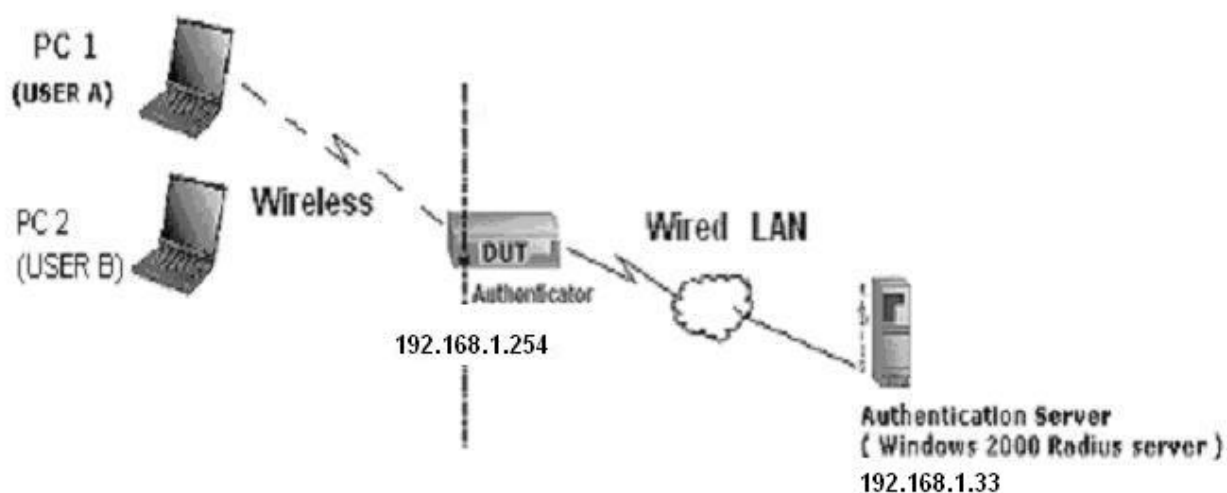

UserA : XP Wireless Card:Ti-11g

Tool: Odyssey Client Manager

Refer to: HHwww.funk.comHH

Download: HHhttp://www.funk.com/News&Events/ody_c_wpa_preview_pn.aspU

Or Another Configuration:

WPA:

For this function, we need the server to authenticate. This function is like 802.1x.

The above is our environment:

Method 1:

1. The UserA or UserB have to get certificate from Radius, first.

HHU<http://192.168.122.1/certsrvU>

account : fae1

passwd : fae1

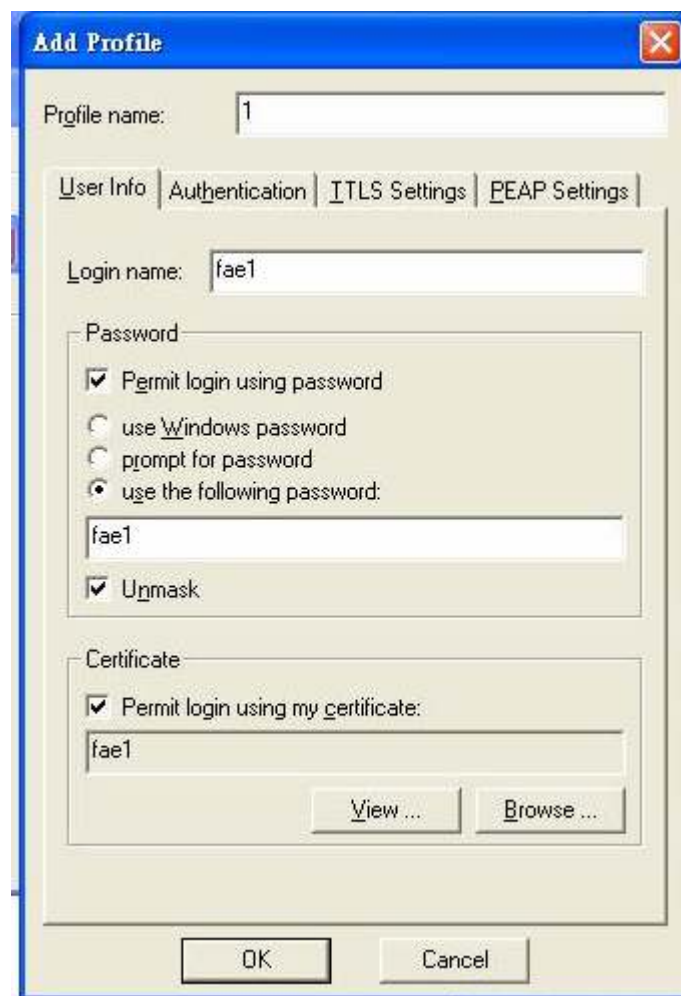

2. Then, Install this certificate and finish.

3. Go to the Web manager of Wireless Router to configure, like below:

Network ID(SSID)	123kk
Channel	8
Security	WPA
802.1X Settings	
RADIUS Server IP	192.168.122.1
RADIUS port	1812
RADIUS Shared Key	costra

4. Go to Odyssey Client Manager, choose “Profiles” and Setup Profile name as “1”

The "Add Profile" dialog box is shown with the "Profile name" field set to "1". The "User Info" tab is selected. The "Login name" field is set to "fae1". Under the "Password" section, the "Permit login using password" checkbox is checked, and the "use the following password" radio button is selected, with the password field set to "fae1". The "Unmask" checkbox is also checked. Under the "Certificate" section, the "Permit login using my certificate" checkbox is checked, and the certificate field is set to "fae1". There are "View ..." and "Browse ..." buttons next to the certificate field. At the bottom are "OK" and "Cancel" buttons.

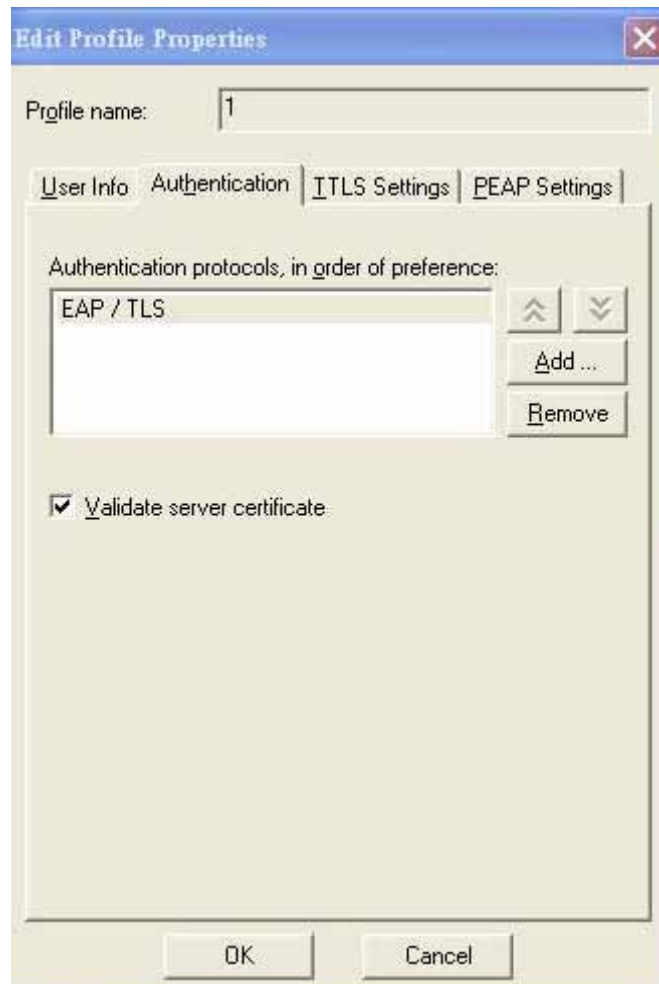

Login name and passwd are fae1 and fae1.

Remember that you get certificate from Radius in Step1.

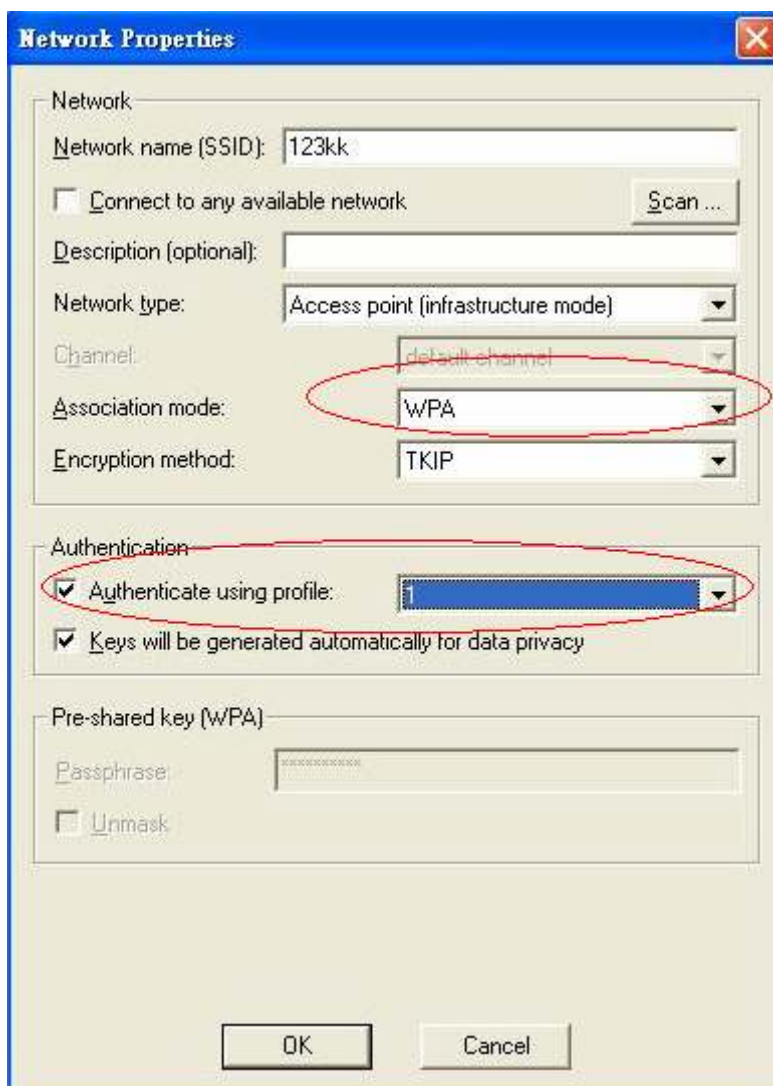

5. Then Choose “certificate” like above.

6. Then go to Authentication and first Remove EAP/ TLS and Add EAP/TLS again.

7. Go “Network” and Select “1” and ok

The image shows a Windows-style dialog box titled "Network Properties". It contains several sections for configuring a network connection. The "Network" section includes fields for "Network name (SSID)" (set to "123kk"), a checkbox for "Connect to any available network", a "Scan ..." button, a "Description (optional)" field, a "Network type" dropdown (set to "Access point (infrastructure mode)"), a "Channel" dropdown (set to "default channel"), an "Association mode" dropdown (set to "WPA"), and an "Encryption method" dropdown (set to "TKIP"). The "Authentication" section has a checked checkbox for "Authenticate using profile:" (with a dropdown menu), and another checked checkbox for "Keys will be generated automatically for data privacy". The "Pre-shared key (WPA)" section includes a "Passphrase" field (masked with asterisks) and an unchecked checkbox for "Unmask". At the bottom are "OK" and "Cancel" buttons. Red circles highlight the "Association mode" dropdown (WPA) and the "Authenticate using profile:" checkbox and dropdown.

Network Properties

Network

Network name (SSID): 123kk

☐ Connect to any available network Scan ...

Description (optional):

Network type: Access point (infrastructure mode)

Channel: default channel

Association mode: WPA

Encryption method: TKIP

Authentication

☒ Authenticate using profile:

☒ Keys will be generated automatically for data privacy

Pre-shared key (WPA)

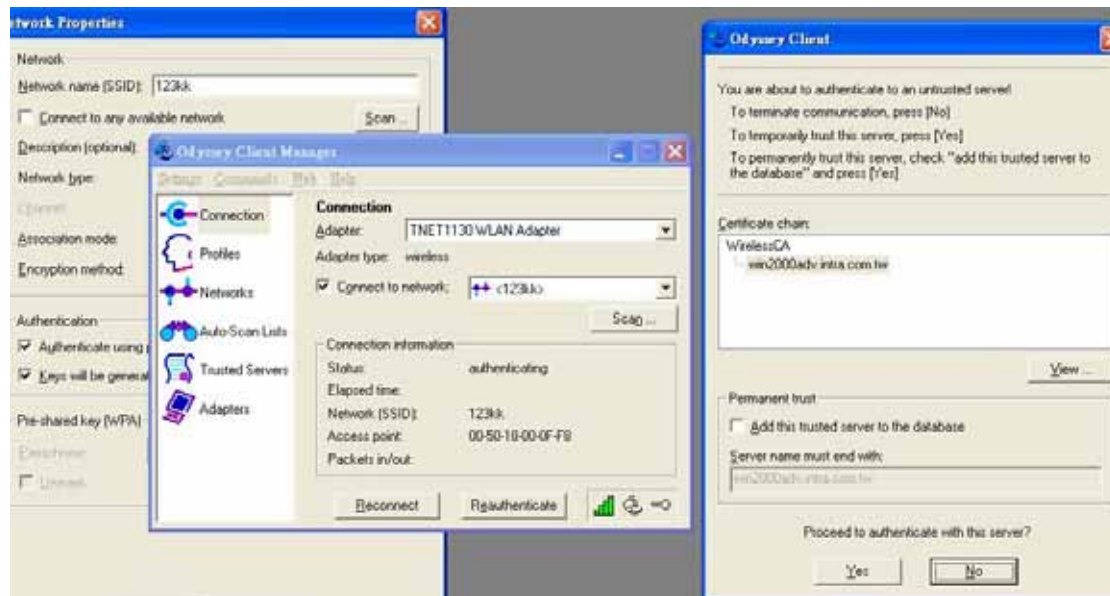

Passphrase:

☐ Unmask

OK Cancel

8. Back to Connection and Select “123kk.

If successfully, the wireless client has to authenticate with Radius Server, like below:

9.Result:

Method 2:

1. The UserA or UserB have to get certificate from Radius,first.

HHU<http://192.168.122.1/certsrvU>

account:fae1

passwd:fae1

2. Then Install this certificate and finish.

3. Setting on the router and client:

Router:

Network ID(SSID)	<input type="text" value="123kk"/>
Channel	<input type="text" value="8"/>
Security	<input type="text" value="WPA"/>
802.1X Settings	
RADIUS Server IP	<input type="text" value="192.168.122.1"/>
RADIUS port	<input type="text" value="1812"/>
RADIUS Shared Key	<input type="text" value="costra"/>

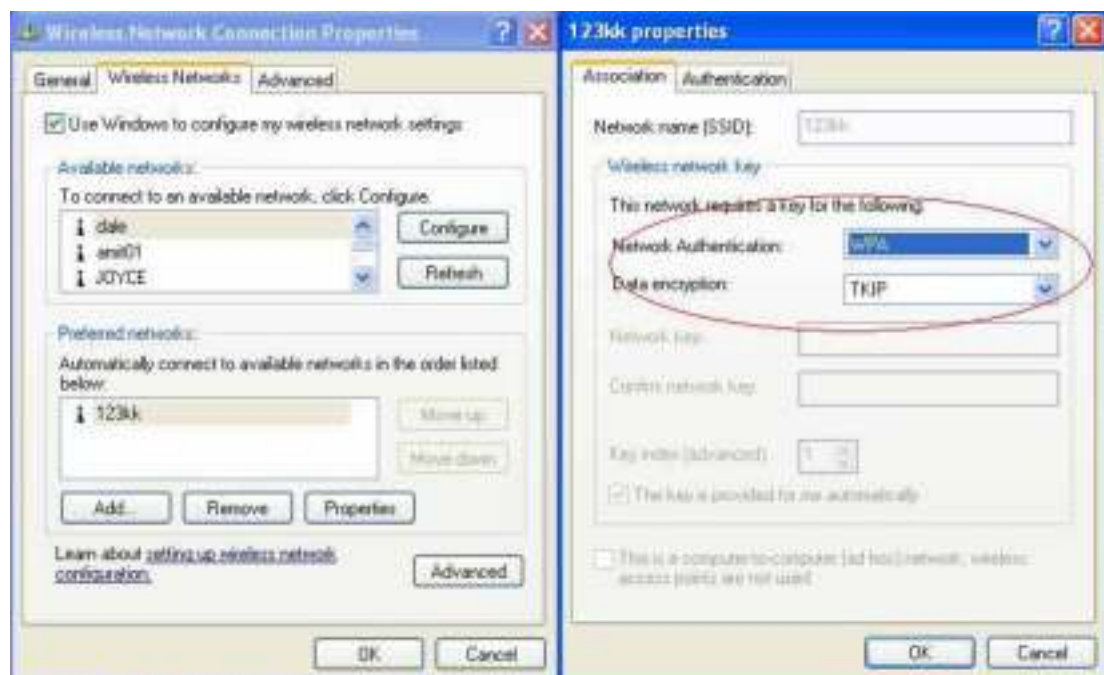

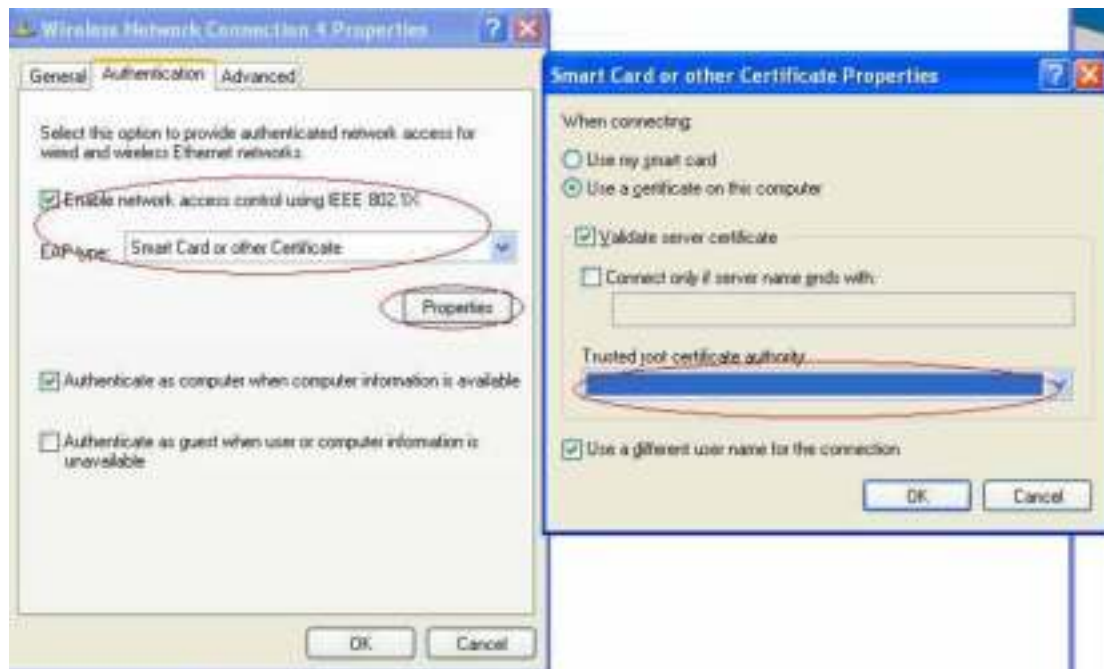

Client:

Go to “Network Connection” and select wireless adapter.

Choose “View available Wireless Networks” like below:

Advanced→ choose “123kk”

Select “WirelessCA and Enable” in Trusted root certificate authority:

Then, if the wireless client wants to associate, it has to request to authenticate.

FAQ and Troubleshooting

What can I do when I have some trouble at the first time?

1. Why can I not configure the router even if the cable is plugged in the ports of Router and the led is also light?

A: First, make sure that which port is plugged. If the cable is in the Wan port, please change to plug in Lan port 1 or Lan port 4:

Then, please check if the Pc gets ip address from Router. Use command mode as below:

```
C:\Documents and Settings\airlive-hpnb>ipconfig

Windows IP Configuration

Ethernet adapter Local Area Connection:

    Connection-specific DNS Suffix  . : 
    IP Address. . . . . : 192.168.1.199
    Subnet Mask . . . . . : 255.255.255.0
    Default Gateway . . . . . : 192.168.1.254
```

If yes, please execute Browser, like Mozilla and key 192.168.1.254 in address.

If not, please ipconfig /release, then ipconfig /renew.

```
C:\>ipconfig /release

Windows IP Configuration

Ethernet adapter Local Area Connection:

    Connection-specific DNS Suffix  . : 
    IP Address. . . . . : 0.0.0.0
    Subnet Mask . . . . . : 0.0.0.0
    Default Gateway . . . . . : 

C:\>ipconfig /renew

Windows IP Configuration

Ethernet adapter Local Area Connection:

    Connection-specific DNS Suffix  . : 192.168.1.199
    IP Address. . . . . : 255.255.255.0
    Subnet Mask . . . . . : 192.168.1.254
    Default Gateway . . . . . :
```

Whatever I setup, the pc can not get ip. Please check Status Led and refer to the Q2:

2.Why can I not connect the router even if the cable is plugged in Lan port and the led is light?

A: First, please check Status Led. If the device is normal, the led will blink per second.

If not, please check How blinking Status led shows.

There are many abnormal symptoms as below:

Status Led is bright or dark in work: The system hanged up .Suggest powering off and on the router. But this symptom often occurs, please reset to default or upgrade latest fw to try again.

Status led flashes irregularly: Maybe the root cause is Flash rom and please press reset Button to reset to default or try to use Recovery mode.(Refer to Q3 and Q4)

Status flashes very fast while powering on: Maybe the router is the recovery mode and please refer to Q4.

3.How to reset to factory default?

A: Press Wireless on /off and WPS button simultaneously about 5 sec

Status will start flashing about 5 times, remove the finger. The RESTORE process is completed.

4.Why can I not connect Internet even though the cables are plugged in Wan port and Lan port and the leds are blink. In addition, Status led is also normal and I can configure web management?

A: Make sure that the network cable from DSL or Cable modem is plugged in Wan port of Router and that the network cable from Lan port of router is plugged in Ethernet adapter. Then, please check which wan type you use. If you are not sure, please call the isp. Then please go to this page to input the information isp is assigned.

Choose WAN Type	
Type	Usage
<input type="radio"/> Static IP Address	ISP assigns you a static IP address.
<input checked="" type="radio"/> Dynamic IP Address	Obtain an IP address from ISP automatically.
<input type="radio"/> Dynamic IP Address with Road Runner Session Management.(e.g. Telstra BigPond)	
<input type="radio"/> PPP over Ethernet	Some ISPs require the use of PPPoE to connect to their services.
<input type="radio"/> PPTP	Some ISPs require the use of PPTP to connect to their services.
<input type="radio"/> L2TP	Some ISPs require the use of L2TP to connect to their services.

5.When I use Static IP Address to roam Internet, I can access or ping global IP 202.93.91.218, But I can not access the site that inputs domain name, for example <http://espn.com> ?

A: Please check the dns configuration of Static IP Address. Please refer to the information of ISP and assign one or two in dns item.

How do I connect router by using wireless?

1.How to start to use wireless?

A: First, make sure that you already installed wireless client device in your computer. Then check the Configuration of wireless router. The default is as below:

Wireless Setting [HELP]	
Item	Setting
Wireless	<input type="radio"/> Enable <input checked="" type="radio"/> Disable
Network ID(SSID)	default
Wireless Mode	<input type="radio"/> 11 b/g/n Mixed <input type="radio"/> 11n only
SSID Broadcast	<input checked="" type="radio"/> Enable <input type="radio"/> Disable
Channel	11
Security	None

About wireless client, you will see wireless icon:

Then click and will see the ap list that wireless client can be accessed:

If the client can not access your wireless router, please refresh network list again. However, I still can not fine the device which ssid is "default", please refer to Q3.

Choose the one that you will want to connect and Connect:

If successfully, the computer will show

and get ip from router:

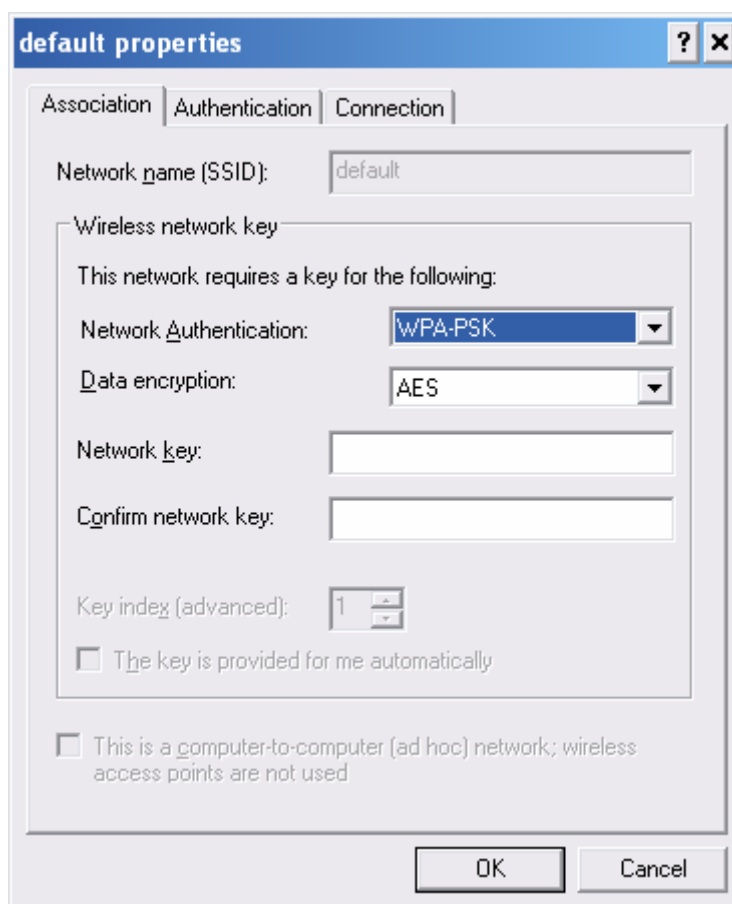

```
Ethernet adapter Local Area Connection 5:
Connection-specific DNS Suffix  . : 
IP Address. . . . . : 192.168.1.165
Subnet Mask . . . . . : 255.255.255.0
Default Gateway . . . . . : 192.168.1.254
```

2. When I use AES encryption of WPA-PSK to connect even if I input the correct pre-share key?

A: First, you must check if the driver of wireless client supports AES encryption. Please refer to the below:

If SSID is default and click “Properties” to check if the driver of wireless client supports AES encryption.

3. When I use wireless to connect the router, but I find the signal is very low even if I am close to the router?

A: Please check if the wireless client is normal, first. If yes, please send the unit to the seller and verify what the problem is.
