CHAPTER 1

McAfee Total Protection

More than just security for your computer, Total Protection is a complete defense system for you and your family as you work or play online. You can use Total Protection to protect your computer against viruses, hackers, and spyware; monitor Internet traffic for suspicious activity; guard your family's privacy; block risky Web sites; and more.

CHAPTER 2

McAfee SecurityCenter

McAfee SecurityCenter allows you to monitor your computer's security status, know instantly whether your computer's virus, spyware, e-mail, and firewall protection services are up-to-date, and act on potential security vulnerabilities. It provides the navigational tools and controls you need to coordinate and manage all areas of your computer's protection.

Before you begin configuring and managing your computer's protection, review the SecurityCenter interface and make sure that you understand the difference between protection status, protection categories, and protection services. Then, update SecurityCenter to ensure that you have the latest protection available from McAfee.

After your initial configuration tasks are complete, you use SecurityCenter to monitor your computer's protection status. If SecurityCenter detects a protection problem, it alerts you so that you can either fix or ignore the problem (depending on its severity). You can also review SecurityCenter events, such as virus scanning configuration changes, in an event log.

Note: SecurityCenter reports critical and non-critical protection problems as soon as it detects them. If you need help diagnosing your protection problems, you can run McAfee Virtual Technician.

In this chapter

| Viewing events..... | 27 |

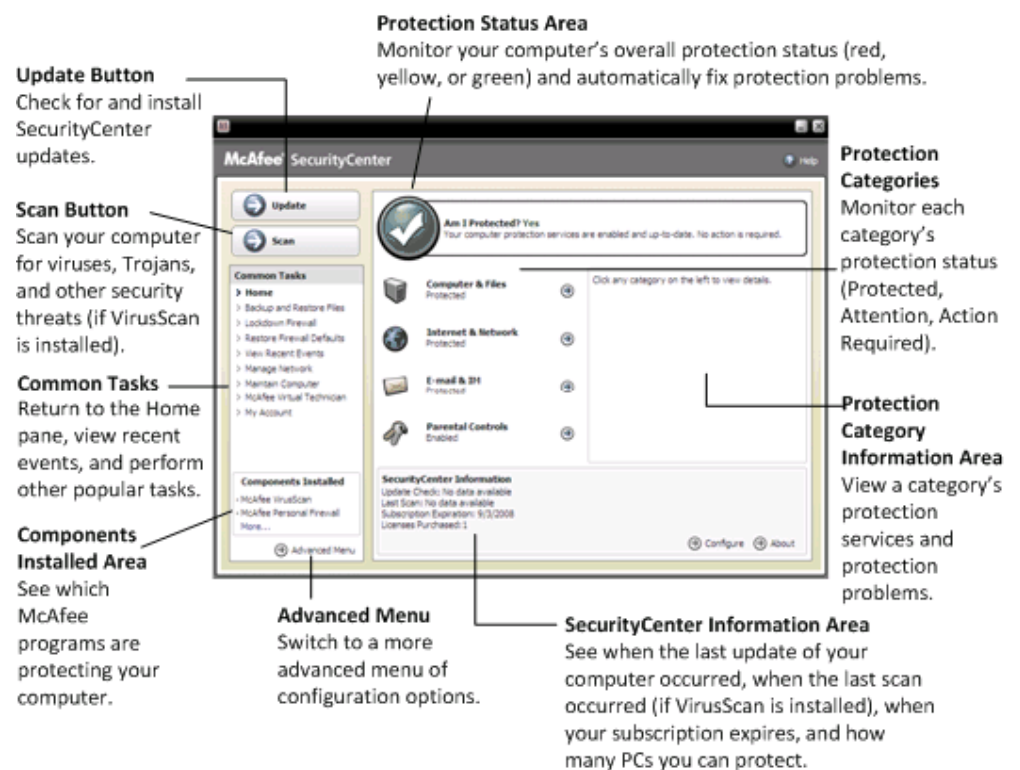

SecurityCenter features

- Simplified protection status** Easily review your computer's protection status, check for updates, and fix protection problems.
- Automated updates and upgrades** SecurityCenter automatically downloads and installs updates for your programs. When a new version of a McAfee program is available, it is automatically delivered to your computer as long as your subscription is valid, ensuring that you always have up-to-date protection.
- Real-time alerts** Security alerts notify you of emergency virus outbreaks and security threats.

CHAPTER 3

Using SecurityCenter

Before you begin using SecurityCenter, review the components and configuration areas you will use to manage your computer's protection status. For more information about the terminology used in this image, see Understanding protection status (page 8) and Understanding protection categories (page 9). Then, you can review your McAfee account information and verifying the validity of your subscription.

In this chapter

| | |
|--|----|
| Understanding protection status..... | 8 |
| Understanding protection categories..... | 9 |
| Understanding protection services | 10 |
| Managing your subscriptions..... | 11 |
| Updating SecurityCenter..... | 13 |

Understanding protection status

Your computer's protection status is shown in the protection status area on the SecurityCenter Home pane. It indicates whether your computer is fully protected against the latest security threats and can be influenced by things like external security attacks, other security programs, and programs that access the Internet.

Your computer's protection status can be red, yellow, or green.

| Protection Status | Description |
|-------------------|--|
| Red | <p>Your computer is not protected. The protection status area on the SecurityCenter Home pane is red and states that you are not protected. SecurityCenter reports at least one critical security problem.</p> <p>To achieve full protection, you must fix all critical security problems in each protection category (the problem category's status is set to Action Required, also in red). For information about how to fix protection problems, see Fixing protection problems (page 17).</p> |
| Yellow | <p>Your computer is partially protected. The protection status area on the SecurityCenter Home pane is yellow and states that you are not protected. SecurityCenter reports at least one non-critical security problem.</p> <p>To achieve full protection, you must fix or ignore the non-critical security problems associated with each protection category. For information about how to fix or ignore protection problems, see Fixing or ignoring protection problems (page 16).</p> |
| Green | <p>Your computer is fully protected. The protection status area on the SecurityCenter Home pane is green and states that you are protected. SecurityCenter does not report any critical or non-critical security problems.</p> <p>Each protection category lists the services that are protecting your computer.</p> |

Understanding protection categories

SecurityCenter's protection services are divided into four categories: Computer & Files, Internet & Network, E-mail & IM, and Parental Controls. These categories help you to browse and configure the security services protecting your computer.

Click a category name to configure its protection services and view any security problems detected for those services. If your computer's protection status is red or yellow, one or more categories display an *Action Required* or *Attention* message, indicating that SecurityCenter has detected a problem within the category. For more information about protection status, see Understanding protection status (page 8).

| Protection Category | Description |
|---------------------|--|
| Computer & Files | The Computer & Files category lets you configure the following protection services: <ul style="list-style-type: none"> ▪ Virus Protection ▪ Spyware Protection ▪ SystemGuards ▪ Windows Protection ▪ PC Health |
| Internet & Network | The Internet & Network category lets you configure the following protection services: <ul style="list-style-type: none"> ▪ Firewall Protection ▪ Phishing Protection ▪ Identity Protection |
| E-mail & IM | The E-mail & IM category lets you configure the following protection services: <ul style="list-style-type: none"> ▪ E-mail Virus Protection ▪ IM Virus Protection ▪ E-mail Spyware Protection ▪ IM Spyware Protection ▪ Spam Protection |
| Parental Controls | The Parental Controls category lets you configure the following protection services: <ul style="list-style-type: none"> ▪ Content Blocking |

Understanding protection services

Protection services are the various security components that you configure to protect your computer and files. Protection services directly correspond to McAfee programs. For example, when you install VirusScan, the following protection services become available: Virus Protection, Spyware Protection, SystemGuards, and Script Scanning. For detailed information about these particular protection services, see the VirusScan help.

By default, all protection services associated with a program are enabled when you install the program; however you can disable a protection service at any time. For example, if you install Parental Controls, Content Blocking and Identity Protection are both enabled. If you do not intend to use the Content Blocking protection service, you can disable it entirely. You can also temporarily disable a protection service while performing setup or maintenance tasks.

Managing your subscriptions

Each McAfee protection product that you purchase comes with a subscription that lets you use the product on a certain number of computers for a certain period of time. The length of your subscription varies according to your purchase, but usually starts when you activate your product. Activation is simple and free—all you need is an Internet connection—but it's very important because it entitles you to receive regular, automatic product updates that keep your computer protected from the latest threats.

Activation normally occurs when the product is installed, but if you decide to wait (for example, if you don't have an Internet connection), you have 15 days to activate. If you don't activate within 15 days, your products will no longer receive critical updates or perform scans. We'll also notify you periodically (with onscreen messages) before your subscription is about to expire. That way you can avoid interruptions in your protection by renewing it early or by setting up auto-renewal on our Web site.

If you see a link in SecurityCenter prompting you to activate, then your subscription has not been activated. To see your subscription's expiration date, you can check your Account page.

Access your McAfee account

You can easily access your McAfee account information (your Account page) from SecurityCenter.

- 1 Under **Common Tasks**, click **My Account**.
- 2 Log in to your McAfee account.

Activate your product

Activation normally occurs when you install your product. But if it hasn't, you'll see a link in SecurityCenter prompting you to activate. We'll also notify you periodically.

- On the SecurityCenter Home pane, under **SecurityCenter Information**, click **Please activate your subscription**.

Tip: You can also activate from the alert that periodically appears.

Verify your subscription

You verify your subscription to ensure that it has not yet expired.

- Right-click the SecurityCenter icon  in the notification area at the far right of your taskbar, and then click **Verify Subscription**.

Renew your subscription

Shortly before your subscription is about to expire, you'll see a link in SecurityCenter prompting you to renew. We'll also notify you periodically about pending expiration with alerts.

- On the SecurityCenter Home pane, under **SecurityCenter Information**, click **Renew**.

Tip: You can also renew your product from the notification message that periodically appears. Or, go to your Account page, where you can renew or set up auto-renewal.

CHAPTER 4

Updating SecurityCenter

SecurityCenter ensures that your registered McAfee programs are current by checking for and installing online updates every four hours. Depending on the programs you have installed and activated, online updates may include the latest virus definitions and hacker, spam, spyware, or privacy protection upgrades. If you want to check for updates within the default four hour period, you can do so at any time. While SecurityCenter is checking for updates, you can continue to perform other tasks.

Although it is not recommended, you can change the way SecurityCenter checks for and installs updates. For example, you can configure SecurityCenter to download but not install updates or to notify you before downloading or installing updates. You can also disable automatic updating.

Note: If you installed your McAfee product from a CD, you must activate within 15 days or your products will not receive critical updates or perform scans.

In this chapter

| | |
|----------------------------------|----|
| Check for updates | 13 |
| Configure automatic updates..... | 14 |
| Disable automatic updates..... | 14 |

Check for updates

By default, SecurityCenter automatically checks for updates every four hours when your computer is connected to the Internet; however, if you want to check for updates within the four hour period, you can do so. If you have disabled automatic updates, it is your responsibility to check for updates regularly.

- On the SecurityCenter Home pane, click **Update**.

Tip: You can check for updates without launching SecurityCenter by right-clicking the SecurityCenter icon  in the notification area at the far right of your taskbar, and then clicking **Updates**.

Configure automatic updates

By default, SecurityCenter automatically checks for and installs updates every four hours when your computer is connected to the Internet. If you want to change this default behavior, you can configure SecurityCenter to automatically download updates and then notify you when the updates are ready to be installed or to notify you before downloading the updates.

Note: SecurityCenter notifies you when updates are ready to be downloaded or installed using alerts. From the alerts, you can either download or install the updates, or postpone the updates. When you update your programs from an alert, you may be prompted to verify your subscription before downloading and installing. For more information, see *Working with alerts* (page 21).

- 1 Open the SecurityCenter Configuration pane.
How?
 1. Under **Common Tasks**, click **Home**.
 2. On the right pane, under **SecurityCenter Information**, click **Configure**.
- 2 On the SecurityCenter Configuration pane, under **Automatic updates are disabled**, click **On**, and then click **Advanced**.
- 3 Click one of the following buttons:
 - **Install the updates automatically and notify me when my services are updated (recommended)**
 - **Download the updates automatically and notify me when they are ready to be installed**
 - **Notify me before downloading any updates**
- 4 Click **OK**.

Disable automatic updates

If you disable automatic updates, it is your responsibility to check for updates regularly; otherwise, your computer will not have the latest security protection. For information about checking for updates manually, see *Check for updates* (page 13).

- 1 Open the SecurityCenter Configuration pane.
How?

1. Under **Common Tasks**, click **Home**.
2. On the right pane, under **SecurityCenter Information**, click **Configure**.
- 2 On the SecurityCenter Configuration pane, under **Automatic updates are enabled**, click **Off**.
- 3 In the confirmation dialog box, click **Yes**.

Tip: You enable automatic updates by clicking the **On** button or by clearing **Disable automatic updating and let me manually check for updates** on the Update Options pane.

Fixing or ignoring protection problems

SecurityCenter reports critical and non-critical protection problems as soon as it detects them. Critical protection problems require immediate action and compromise your protection status (changing the color to red). Non-critical protection problems do not require immediate action and may or may not compromise your protection status (depending on the type of problem). To achieve a green protection status, you must fix all critical problems and either fix or ignore all non-critical problems. If you need help diagnosing your protection problems, you can run McAfee Virtual Technician. For more information about McAfee Virtual Technician, see the McAfee Virtual Technician help.

In this chapter

| | |
|------------------------------------|----|
| Fixing protection problems | 17 |
| Ignoring protection problems | 19 |

Fixing protection problems

Most security problems can be fixed automatically; however, some problems may require you to take action. For example, if Firewall Protection is disabled, SecurityCenter can enable it automatically; however, if Firewall Protection is not installed, you must install it. The following table describes some other actions that you might take when fixing protection problems manually:

| Problem | Action |
|--|--|
| A full scan of your computer has not been performed in the last 30 days. | Scan your computer manually. For more information, see the VirusScan help. |
| Your detection signature files (DATs) are out-of-date. | Update your protection manually. For more information, see the VirusScan help. |
| A program is not installed. | Install the program from the McAfee Web site or CD. |
| A program is missing components. | Reinstall the program from the McAfee Web site or CD. |
| A program is not activated, and cannot receive full protection. | Activate the program on the McAfee Web site. |
| Your subscription has expired. | Check your account status on the McAfee Web site. For more information, see Managing your subscriptions (page 11). |

Note: Often, a single protection problem affects more than one protection category. In this case, fixing the problem in one category clears it from all other protection categories.

Fix protection problems automatically

SecurityCenter can fix most protection problems automatically. The configuration changes that SecurityCenter makes when automatically fixing protection problems are not recorded in the event log. For more information about events, see Viewing events (page 27).

- 1 Under **Common Tasks**, click **Home**.
- 2 On the SecurityCenter Home pane, in the protection status area, click **Fix**.

Fix protection problems manually

If one or more protection problems persist after you try to fix them automatically, you can fix the problems manually.

- 1 Under **Common Tasks**, click **Home**.
- 2 On the SecurityCenter Home pane, click the protection category in which SecurityCenter reports the problem.
- 3 Click the link following the description of the problem.

Ignoring protection problems

If SecurityCenter detects a non-critical problem, you can either fix or ignore it. Other non-critical problems (for example, if Anti-Spam or Parental Controls are not installed) are automatically ignored. Ignored problems are not shown in the protection category information area on the SecurityCenter Home pane, unless your computer's protection status is green. If you ignore a problem, but later decide that you want it to appear in the protection category information area even when your computer's protection status is not green, you can show the ignored problem.

Ignore a protection problem

If SecurityCenter detects a non-critical problem that you do not intend to fix, you can ignore it. Ignoring it removes the problem from the protection category information area in SecurityCenter.

- 1 Under **Common Tasks**, click **Home**.
- 2 On the SecurityCenter Home pane, click the protection category in which the problem is reported.
- 3 Click the **Ignore** link beside the protection problem.

Show or hide ignored problems

Depending on its severity, you can show or hide an ignored protection problem.

- 1 Open the Alert Options pane.
How?
 1. Under **Common Tasks**, click **Home**.
 2. On the right pane, under **SecurityCenter Information**, click **Configure**.
 3. Under **Alerts**, click **Advanced**.
- 2 On the SecurityCenter Configuration pane, click **Ignored Problems**.
- 3 On the Ignored Problems pane, do the following:
 - To ignore a problem, select its check box.
 - To report a problem in the protection category information area, clear its check box.

4 Click **OK**.

Tip: You can also ignore a problem by clicking the **Ignore** link beside the reported problem in the protection category information area.

CHAPTER 5

Working with alerts

Alerts are small pop-up dialog boxes that appear in the bottom-right corner of your screen when certain SecurityCenter events occur. An alert provides detailed information about an event as well as recommendations and options for resolving problems that may be associated with the event. Some alerts also contain links to additional information about the event. These links let you launch McAfee's global Web site or send information to McAfee for troubleshooting.

There are three types of alerts: red, yellow, and green.

| Alert Type | Description |
|------------|--|
| Red | A red alert is a critical notification that requires a response from you. Red alerts occur when SecurityCenter cannot determine how to fix a protection problem automatically. |
| Yellow | A yellow alert is a non-critical notification that usually requires a response from you. |
| Green | A green alert is a non-critical notification that does not require a response from you. Green alerts provide basic information about an event. |

Because alerts play such an important role in monitoring and managing your protection status, you cannot disable them. However, you can control whether certain types of informational alerts appear and configure some other alert options (such as whether SecurityCenter plays a sound with an alert or displays the McAfee splash screen on startup).

In this chapter

| | |
|---|----|
| Showing and hiding informational alerts | 22 |
| Configuring alert options | 24 |

Showing and hiding informational alerts

Informational alerts notify you when events occur that do not pose threats to your computer's security. For example, if you have set up Firewall Protection, an informational alert appears by default whenever a program on your computer is granted access to the Internet. If you do not want a specific type of informational alert to appear, you can hide it. If you do not want any informational alerts to appear, you can hide them all. You can also hide all informational alerts when you play a game in full-screen mode on your computer. When you finish playing the game and exit full-screen mode, SecurityCenter starts displaying informational alerts again.

If you mistakenly hide an informational alert, you can show it again at any time. By default, SecurityCenter shows all informational alerts.

Show or hide informational alerts

You can configure SecurityCenter to show some informational alerts and hide others, or to hide all informational alerts.

- 1 Open the Alert Options pane.
How?
 1. Under **Common Tasks**, click **Home**.
 2. On the right pane, under **SecurityCenter Information**, click **Configure**.
 3. Under **Alerts**, click **Advanced**.
- 2 On the SecurityCenter Configuration pane, click **Informational Alerts**.
- 3 On the Informational Alerts pane, do the following:
 - To show an informational alert, clear its check box.
 - To hide an informational alert, select its check box.
 - To hide all informational alerts, select the **Do not show informational alerts** check box.
- 4 Click **OK**.

Tip: You can also hide an informational alert by selecting the **Do not show this alert again** check box in the alert itself. If you do so, you can show the informational alert again by clearing the appropriate check box on the Informational Alerts pane.

Show or hide informational alerts when gaming

You can hide informational alerts when you are playing a game in full-screen mode on your computer. When you finish the game and exit full-screen mode, SecurityCenter starts displaying informational alerts again.

- 1** Open the Alert Options pane.
How?
 1. Under **Common Tasks**, click **Home**.
 2. On the right pane, under **SecurityCenter Information**, click **Configure**.
 3. Under **Alerts**, click **Advanced**.
- 2** On the Alert Options pane, select or clear the **Show informational alerts when gaming mode is detected** check box.
- 3** Click **OK**.

Configuring alert options

The appearance and frequency of alerts is configured by SecurityCenter; however, you can adjust some basic alert options. For example, you can play a sound with alerts or hide the splash screen alert from displaying when Windows starts. You can also hide alerts that notify you about virus outbreaks and other security threats in the online community.

Play a sound with alerts

If you want to receive an audible indication that an alert has occurred, you can configure SecurityCenter to play a sound with each alert.

- 1 Open the Alert Options pane.
How?
 1. Under **Common Tasks**, click **Home**.
 2. On the right pane, under **SecurityCenter Information**, click **Configure**.
 3. Under **Alerts**, click **Advanced**.
- 2 On the Alert Options pane, under **Sound**, select the **Play a sound when an alert occurs** check box.

Hide the splash screen at startup

By default, the McAfee splash screen appears briefly when Windows starts, notifying you that SecurityCenter is protecting your computer. However, you can hide the splash screen if you do not want it to appear.

- 1 Open the Alert Options pane.
How?
 1. Under **Common Tasks**, click **Home**.
 2. On the right pane, under **SecurityCenter Information**, click **Configure**.
 3. Under **Alerts**, click **Advanced**.
- 2 On the Alert Options pane, under **Splash Screen**, clear the **Show the McAfee splash screen when Windows starts** check box.

Tip: You can show the splash screen again at any time by selecting the **Show the McAfee splash screen when Windows starts** check box.

Hide virus outbreak alerts

You can hide alerts that notify you about virus outbreaks and other security threats in the online community.

- 1 Open the Alert Options pane.
How?
 1. Under **Common Tasks**, click **Home**.
 2. On the right pane, under **SecurityCenter Information**, click **Configure**.
 3. Under **Alerts**, click **Advanced**.
- 2 On the Alert Options pane, clear the **Alert me when a virus or security threat occurs** check box.

Tip: You can show virus outbreak alerts at any time by selecting the **Alert me when a virus or security threat occurs** check box.

Hide security messages

You can hide security notifications about protecting more computers on your home network. These messages provide information about your subscription, the number of computers you can protect with your subscription, and how to extend your subscription to protect even more computers.

- 1 Open the Alert Options pane.
How?
 1. Under **Common Tasks**, click **Home**.
 2. On the right pane, under **SecurityCenter Information**, click **Configure**.
 3. Under **Alerts**, click **Advanced**.
- 2 On the Alert Options pane, clear the **Show virus advisories or other security messages** check box.

Tip: You can show these security messages at any time by selecting the **Show virus advisories or other security messages** check box.

CHAPTER 6

Viewing events

An event is an action or configuration change that occurs within a protection category and its related protection services. Different protection services record different types of events. For example, SecurityCenter records an event if a protection service is enabled or disabled; Virus Protection records an event each time a virus is detected and removed; and Firewall Protection records an event each time an Internet connection attempt is blocked. For more information about protection categories, see Understanding protection categories (page 9).

You can view events when troubleshooting configuration issues and reviewing operations performed by other users. Many parents use the event log to monitor their children's behavior on the Internet. You view recent events if you want to examine only the last 30 events that occurred. You view all events if you want to examine a comprehensive list of all events that occurred. When you view all events, SecurityCenter launches the event log, which sorts events according to the protection category in which they occurred.

In this chapter

| | |
|--------------------------|----|
| View recent events | 27 |
| View all events | 27 |

View recent events

You view recent events if you want to examine only the last 30 events that occurred.

- Under **Common Tasks**, click **View Recent Events**.

View all events

You view all events if you want to examine a comprehensive list of all events that occurred.

- 1 Under **Common Tasks**, click **View Recent Events**.
- 2 On the Recent Events pane, click **View Log**.
- 3 On the event log's left pane, click the type of events you want to view.

CHAPTER 7

McAfee VirusScan

VirusScan's advanced detection and protection services defend you and your computer from the latest security threats, including viruses, Trojans, tracking cookies, spyware, adware, and other potentially unwanted programs. Protection extends beyond the files and folders on your desktop, targeting threats from different points of entry—including e-mail, instant messages, and the Web.

With VirusScan, your computer's protection is immediate and constant (no tedious administration required). While you work, play, browse the Web, or check your e-mail, it runs in the background, monitoring, scanning, and detecting potential harm in real time. Comprehensive scans run on schedule, periodically checking your computer using a more sophisticated set of options. VirusScan offers you the flexibility to customize this behavior if you want to; but if you don't, your computer remains protected.

With normal computer use, viruses, worms, and other potential threats may infiltrate your computer. If this occurs, VirusScan notifies you about the threat, but usually handles it for you, cleaning or quarantining infected items before any damage occurs. Although rare, further action may sometimes be required. In these cases, VirusScan lets you decide what to do (rescan the next time you start your computer, keep the detected item, or remove the detected item).

Note: SecurityCenter reports critical and non-critical protection problems as soon as it detects them. If you need help diagnosing your protection problems, you can run McAfee Virtual Technician.

In this chapter

|-----------------------------------|----|
| VirusScan features..... | 30 |
| Scanning your computer | 31 |
| Working with scan results..... | 35 |
| Scan types | 38 |
| Using additional protection | 41 |
| Setting up virus protection | 45 |

VirusScan features

Comprehensive virus protection

Defend yourself and your computer from the latest security threats, including viruses, Trojans, tracking cookies, spyware, adware, and other potentially unwanted programs. Protection extends beyond the files and folders and on your desktop, targeting threats from different points of entry—including e-mail, instant messages, and the Web. No tedious administration required.

Resource-aware scanning options

Customize scanning options if you want to; but if you don't, your computer remains protected. If you experience slow scan speeds, then you can disable the option to use minimal computer resources, but keep in mind that higher priority will be given to virus protection than to other tasks.

Automatic repairs

If VirusScan detects a security threat while running a scan, it tries to handle the threat automatically according to the threat type. This way, most threats can be detected and neutralized without your interaction. Although rare, VirusScan may not be able to neutralize a threat on its own. In these cases, VirusScan lets you decide what to do (rescan the next time you start your computer, keep the detected item, or remove the detected item).

Pausing tasks in full-screen mode

When enjoying activities like watching movies, playing games on your computer, or any activity that occupies your entire computer screen, VirusScan pauses a number of tasks, such as manual scans.

CHAPTER 8

Scanning your computer

Even before you start SecurityCenter for the first time, VirusScan's real-time virus protection starts protecting your computer from potentially harmful viruses, Trojans, and other security threats. Unless you disable real-time virus protection, VirusScan constantly monitors your computer for virus activity, scanning files each time you or your computer access them, using the real-time scanning options that you set. To make sure that your computer stays protected against the latest security threats, leave real-time virus protection on and set up a schedule for regular, more comprehensive manual scans. For more information about setting scan options, see *Setting up virus protection* (page 45).

VirusScan provides a more detailed set of scanning options for virus protection, allowing you to periodically run more extensive scans. You can run full, quick, custom, or scheduled scan from SecurityCenter. You can also run manual scans in Windows Explorer while you work. Scanning in SecurityCenter offers the advantage of changing scanning options on-the-fly. However, scanning from Windows Explorer offers a convenient approach to computer security.

Whether you run a scan from SecurityCenter or Windows Explorer, you can view the scan results when it finishes. You view the results of a scan to determine whether VirusScan has detected, repaired, or quarantined viruses, trojans, spyware, adware, cookies, and other potentially unwanted programs. The results of a scan can be displayed in different ways. For example, you can view a basic summary of scan results or detailed information, such as the infection status and type. You can also view general scan and detection statistics.

In this chapter

| | |
|-------------------------|----|
| Scan your PC..... | 31 |
| View scan results | 33 |

Scan your PC

VirusScan provides a complete set of scanning options for virus protection, including real-time scanning (which constantly monitors your PC for threat activity), manual scanning from Windows Explorer, and full, quick, custom, or scheduled scan from SecurityCenter.

| To... | Do this... |
|-------|------------|
|-------|------------|

| To... | Do this... |
|--|--|
| Start Real-time scanning to constantly monitor your computer for virus activity, scanning files each time you or your computer access them | <p>1. Open the Computer & Files Configuration pane.</p> <p>How?</p> <ol style="list-style-type: none"> 1. On the left pane, click Advanced Menu. 2. Click Configure. 3. On the Configure pane, click Computer & Files. <p>2. Under Virus protection, click On.</p> <p>Note: Real-time scanning is enabled by default.</p> |
| Start a QuickScan to quickly check your computer for threats | <ol style="list-style-type: none"> 1. Click Scan on the Basic menu. 2. On the Scan Options pane, under Quick Scan, click Start. |
| Start a Full Scan to thoroughly check your computer for threats | <ol style="list-style-type: none"> 1. Click Scan on the Basic menu. 2. On the Scan Options pane, under Full Scan, click Start. |
| Start a Custom Scan based on your own settings | <ol style="list-style-type: none"> 1. Click Scan on the Basic menu. 2. On the Scan Options pane, under Let Me Choose, click Start. 3. Customize a scan by clearing or selecting: <ul style="list-style-type: none"> All threats in All Files Unknown Viruses Archive Files Spyware and Potential Threats Tracking Cookies Stealth Programs 4. Click Start. |
| Start a Manual Scan to check for threats in files, folders or drives | <ol style="list-style-type: none"> 1. Open Windows Explorer. 2. Right-click a file, folder, or drive, and then click Scan. |

| To... | Do this... |
|--|--|
| Start a Scheduled Scan that periodically scans your computer for threats | <p>1. Open the Scheduled Scan pane.</p> <p>How?</p> <ol style="list-style-type: none"> 1. Under Common Tasks, click Home. 2. On the SecurityCenter Home pane, click Computer & Files. 3. In the Computer & Files information area, click Configure. 4. On the Computer & Files Configuration pane, ensure that virus protection is enabled, and click Advanced. 5. Click Scheduled Scan in the Virus Protection pane. <p>2. Select Enable scheduled scanning.</p> <p>3. To reduce the amount of processor power normally used for scanning, select Scan using minimal computer resources.</p> <p>4. Select one or more days.</p> <p>5. Specify a start time.</p> <p>6. Click OK.</p> |

The scan results appear in the Scan completed alert. Results include the number of items scanned, detected, repaired, quarantined, and removed. Click **View scan details** to learn more about the scan results or to work with infected items.

Note: To learn more about scan options, see Scan Types. (page 38)

View scan results

When a scan finishes, you view the results to determine what the scan found and to analyze the current protection status of your computer. Scan results tell you whether VirusScan detected, repaired, or quarantined viruses, trojans, spyware, adware, cookies, and other potentially unwanted programs.

On the Basic or Advanced menu, click **Scan** and then do one of the following:

| To... | Do this... |
|-------|------------|
|-------|------------|

| To... | Do this... |
|---|---|
| View scan results in the alert | View scan results in the Scan completed alert. |
| View more information about scan results | Click View scan details in the Scan completed alert. |
| View a quick summary of the scan results | Point to the Scan completed icon in the notification area on your taskbar. |
| View scan and detection statistics | Double-click the Scan completed icon in the notification area on your taskbar. |
| View details about detected items, infection status, and type | <ol style="list-style-type: none">1. Double-click the Scan completed icon in the notification area on your taskbar.2. Click Details on either the Full Scan, Quick Scan, Custom Scan, or Manual Scan pane. |
| View details about your most recent scan | Double-click the Scan completed icon in the notification area on your taskbar and view the details of your most recent scan under Your Scan on either the Full Scan, Quick Scan, Custom Scan, or Manual Scan pane. |

CHAPTER 9

Working with scan results

If VirusScan detects a security threat while running a scan, it tries to handle the threat automatically according to the threat type. For example, if VirusScan detects a virus, Trojan, or tracking cookie on your computer, it tries to clean the infected file. VirusScan always quarantines a file before attempting to clean it. If it's not clean, the file is quarantined.

With some security threats, VirusScan may not be able to clean or quarantine a file successfully. In this case, VirusScan prompts you to handle the threat. You can take different actions depending on the threat type. For example, if a virus is detected in a file, but VirusScan cannot successfully clean or quarantine the file, it denies further access to it. If tracking cookies are detected, but VirusScan cannot successfully clean or quarantine the cookies, you can decide whether to remove or trust the them. If potentially unwanted programs are detected, VirusScan does not take any automatic action; instead, it lets you decide whether to quarantine or trust the program.

When VirusScan quarantines items, it encrypts and then isolates them in a folder to prevent the files, programs, or cookies from harming your computer. You can restore or remove the quarantined items. In most cases, you can delete a quarantined cookie without impacting your system; however, if VirusScan has quarantined a program that you recognize and use, consider restoring it.

In this chapter

| | |
|---|----|
| Work with viruses and Trojans | 35 |
| Work with potentially unwanted programs | 36 |
| Work with quarantined files | 36 |
| Work with quarantined programs and cookies..... | 37 |

Work with viruses and Trojans

If VirusScan detects a virus or Trojan in a file on your computer, it tries to clean the file. If it cannot clean the file, VirusScan tries to quarantine it. If this too fails, access to the file is denied (in real-time scans only).

1 Open the Scan Results pane.

How?

1. Double-click the **Scan completed** icon in the notification area at the far right of your taskbar.
2. On the Scan pane, click **Details**.

2 In the scan results list, click **Viruses and Trojans**.

Note: To work with the files that VirusScan has quarantined, see [Work with quarantined files](#) (page 36).

Work with potentially unwanted programs

If VirusScan detects a potentially unwanted program on your computer, you can either remove or trust the program. If you are unfamiliar with the program, we recommend that you consider removing it. Removing the potentially unwanted program does not actually delete it from your system. Instead, removing quarantines the program to prevent it from causing damage to your computer or files.

- 1 Open the Scan Results pane.
How?
 1. Double-click the **Scan completed** icon in the notification area at the far right of your taskbar.
 2. On the Scan pane, click **Details**.
- 2 In the scan results list, click **Potentially Unwanted Programs**.
- 3 Select a potentially unwanted program.
- 4 Under **I want to**, click either **Remove** or **Trust**.
- 5 Confirm your selected option.

Work with quarantined files

When VirusScan quarantines infected files, it encrypts and then moves them to a folder to prevent the files from harming your computer. You can then restore or remove the quarantined files.

- 1 Open the Quarantined Files pane.
How?
 1. On the left pane, click **Advanced Menu**.
 2. Click **Restore**.
 3. Click **Files**.
- 2 Select a quarantined file.
- 3 Do one of the following:
 - To repair the infected file and return it to its original location on your computer, click **Restore**.

- To remove the infected file from your computer, click **Remove**.

4 Click **Yes** to confirm your selected option.

Tip: You can restore or remove multiple files at the same time.

Work with quarantined programs and cookies

When VirusScan quarantines potentially unwanted programs or tracking cookies, it encrypts and then moves them to a protected folder to prevent the programs or cookies from harming your computer. You can then restore or remove the quarantined items. In most cases, you can delete a quarantined without impacting your system.

1 Open the Quarantined Programs and Tracking Cookies pane.

How?

1. On the left pane, click **Advanced Menu**.
2. Click **Restore**.
3. Click **Programs and Cookies**.

2 Select a quarantined program or cookie.

3 Do one of the following:

- To repair the infected file and return it to its original location on your computer, click **Restore**.
- To remove the infected file from your computer, click **Remove**.

4 Click **Yes** to confirm the operation.

Tip: You can restore or remove multiple programs and cookies at the same time.

Scan types

VirusScan provides a complete set of scanning options for virus protection, including real-time scanning (which constantly monitors your PC for threat activity), manual scanning from Windows Explorer, and the ability to run a full, quick, custom scan from SecurityCenter, or customize when scheduled scans will occur. Scanning in SecurityCenter offers the advantage of changing scanning options on-the-fly.

Real-Time Scanning:

Real-time virus protection constantly monitors your computer for virus activity, scanning files each time you or your computer access them. To make sure that your computer stays protected against the latest security threats, leave real-time virus protection on and set up a schedule for regular, more comprehensive, manual scans.

You can set default options for real-time scanning, which include scanning for unknown viruses, and checking for threats in tracking cookies and network drives. You can also take advantage of buffer overflow protection, which is enabled by default (except if you are using a Windows Vista 64-bit operating system). To learn more, see [Setting real-time scan options \(page 46\)](#).

Quick Scan

Quick Scan allows you to check for threat activity in processes, critical Windows files, and other susceptible areas on your computer.

Full Scan

Full Scan allows you to thoroughly check your entire computer for viruses, spyware, and other security threats that exist anywhere on your PC.

Custom Scan

Custom Scan allows you to choose your own scan settings to check for threat activity on your PC. Custom scan options include checking for threats in all files, in archive files, and in cookies in addition to scanning for unknown viruses, spyware, and stealth programs.

You can set default options for custom scans, which include scanning for unknown viruses, archive files, spyware and potential threats, tracking cookies, and stealth programs. You can also scan using minimal computer resources. To learn more, see [Setting custom scan options \(page 48\)](#)

Manual Scan

Manual Scan allows you to quickly check for threats in files, folders, and drives on the fly from Windows Explorer.

Schedule scan

Scheduled scans thoroughly check your computer for viruses and other threats any day and time of the week. Scheduled scans always check your entire computer using your default scan options. By default, VirusScan performs a scheduled scan once a week. If you find that you are experiencing slow scan speeds, consider disabling the option to use minimal computer resources, but keep in mind that higher priority will be given to virus protection than to other tasks. To learn more, see [Scheduling a scan](#) (page 51)

Note: To learn how to start the best scan option for you, see [Scan your PC](#) (page 31)

CHAPTER 10

Using additional protection

In addition to real-time virus protection, VirusScan provides advanced protection against scripts, spyware, and potentially harmful e-mail and instant message attachments. By default, script scanning, spyware, e-mail, and instant messaging protection are turned on and protecting your computer.

Script scanning protection

Script scanning protection detects potentially harmful scripts and prevents them from running on your computer or web browser. It monitors your computer for suspect script activity, such as a script that creates, copies, or deletes files, or opens your Windows registry, and alerts you before any damage occurs.

Spyware protection

Spyware protection detects spyware, adware, and other potentially unwanted programs. Spyware is software that can be secretly installed on your computer to monitor your behavior, collect personal information, and even interfere with your control of the computer by installing additional software or redirecting browser activity.

E-mail protection

E-mail protection detects suspect activity in the e-mail and attachments you send.

Instant messaging protection

Instant messaging protection detects potential security threats from instant message attachments that you receive. It also prevents instant messaging programs from sharing personal information.

In this chapter

| | |
|--|----|
| Start script scanning protection..... | 42 |
| Start spyware protection..... | 42 |
| Start e-mail protection..... | 42 |
| Start instant messaging protection | 43 |

Start script scanning protection

Turn on script scanning protection to detect potentially harmful scripts and prevent them from running on your computer. Script scanning protection alerts you when a script tries to create, copy, or delete files on your computer, or make changes to your Windows registry.

1 Open the Computer & Files Configuration pane.

How?

1. On the left pane, click **Advanced Menu**.
2. Click **Configure**.
3. On the Configure pane, click **Computer & Files**.

2 Under **Script scanning protection**, click **On**.

Note: Although you can turn off script scanning protection at any time, doing so leaves your computer vulnerable to harmful scripts.

Start spyware protection

Turn on spyware protection to detect and remove spyware, adware, and other potentially unwanted programs that gather and transmit information without your knowledge or permission.

1 Open the Computer & Files Configuration pane.

How?

1. On the left pane, click **Advanced Menu**.
2. Click **Configure**.
3. On the Configure pane, click **Computer & Files**.

2 Under **spyware protection**, click **On**.

Note: Although you can turn off spyware protection at any time, doing so leaves your computer vulnerable to potentially unwanted programs.

Start e-mail protection

Turn on e-mail protection to detect worms as well as potential threats in inbound (POP3) e-mail messages and attachments.

1 Open the E-mail & IM Configuration pane.

How?

1. On the left pane, click **Advanced Menu**.
2. Click **Configure**.
3. On the Configure pane, click **E-mail & IM**.

2 Under E-mail protection, click On.

Note: Although you can turn off e-mail protection at any time, doing so leaves your computer vulnerable to e-mail threats.

Start instant messaging protection

Turn on instant messaging protection to detect security threats that can be included in inbound instant message attachments.

1 Open the E-mail & IM Configuration pane.

How?

1. On the left pane, click **Advanced Menu**.
2. Click **Configure**.
3. On the Configure pane, click **E-mail & IM**.

2 Under Instant Messaging protection, click On.

Note: Although you can turn off instant messaging protection at any time, doing so leaves your computer vulnerable to harmful instant message attachments.

CHAPTER 11

Setting up virus protection

You can set different options for scheduled, custom, and real-time scanning. For example, because real-time protection continuously monitors your computer, you might select a certain set of basic scanning options, reserving a more comprehensive set of scanning options for manual, on-demand protection.

You can also decide how you would like VirusScan to monitor and manage potentially unauthorized or unwanted changes on your PC using SystemGuards and Trusted Lists. SystemGuards monitor, log, report, and manage potentially unauthorized changes made to the Windows registry or critical system files on your computer. Unauthorized registry and file changes can harm your computer, compromise its security, and damage valuable system files. You can use Trusted Lists to decide whether you want to trust or remove rules that detect file or registry changes (SystemGuard), program, or buffer overflows. If you trust the item and indicate that you do not want to receive future notification about its activity, the item is added to a trusted list and VirusScan no longer detects it or notifies you about its activity.

In this chapter

| | |
|--------------------------------------|----|
| Setting real-time scan options | 46 |
| Setting custom scan options | 48 |
| Scheduling a scan..... | 51 |
| Using SystemGuards options | 52 |
| Using trusted lists..... | 58 |

Setting real-time scan options

When you start real-time virus protection, VirusScan uses a default set of options to scan files; however, you can change the default options to suit your needs.

To change real-time scanning options, you must make decisions about what VirusScan checks for during a scan, as well as the locations and file types it scans. For example, you can determine whether VirusScan checks for unknown viruses or cookies that Web sites can use to track your behavior, and whether it scans network drives that are mapped to your computer or just local drives. You can also determine what types of files are scanned (all files, or just program files and documents, since that is where most viruses are detected).

When changing real-time scanning options, you must also determine whether it's important for your computer to have buffer overflow protection. A buffer is a portion of memory used to temporarily hold computer information. Buffer overflows can occur when the amount of information suspect programs or processes store in a buffer exceeds the buffer's capacity. When this occurs, your computer becomes more vulnerable to security attacks.

Set real-time scan options

You set real-time scan options to customize what VirusScan looks for during a real-time scan, as well as the locations and file types it scans. Options include scanning for unknown viruses and tracking cookies as well as providing buffer overflow protection. You can also configure real-time scanning to check network drives that are mapped to your computer.

1 Open the Real-Time Scanning pane.

How?

1. Under **Common Tasks**, click **Home**.
2. On the SecurityCenter Home pane, click **Computer & Files**.
3. In the Computer & Files information area, click **Configure**.
4. On the Computer & Files Configuration pane, ensure that virus protection is enabled, and then click **Advanced**.

2 Specify your real-time scanning options, and then click **OK**.

| To... | Do this... |
|--|--|
| Detect unknown viruses and new variants of known viruses | Select Scan for unknown viruses . |

| To... | Do this... |
|---|---|
| Detect cookies | Select Scan and remove tracking cookies. |
| Detect viruses and other potential threats on drives that are connected to your network | Select Scan network drives. |
| Protect your computer from buffer overflows | Select Enable buffer overflow protection. |
| Specify which types of files to scan | Click either All files (recommended) or Program files and documents only. |

Stop real-time virus protection

Although rare, there may be times when you want to temporarily stop real-time scanning (for example, to change some scanning options or troubleshoot a performance issue). When real-time virus protection is disabled, your computer is not protected and your SecurityCenter protection status is red. For more information about protection status, see "Understanding protection status" in the SecurityCenter help.

You can turn off real-time virus protection temporarily, and then specify when it resumes. You can automatically resume protection after 15, 30, 45, or 60 minutes, when your computer restarts, or never.

- 1 Open the Computer & Files Configuration pane.
How?
 1. On the left pane, click **Advanced Menu**.
 2. Click **Configure**.
 3. On the Configure pane, click **Computer & Files**.
- 2 Under **Virus protection**, click **Off**.
- 3 In the dialog box, select when to resume real-time scanning.
- 4 Click **OK**.

Setting custom scan options

Custom virus protection lets you scan files on demand. When you start a custom scan, VirusScan checks your computer for viruses and other potentially harmful items using a more comprehensive set of scanning options. To change custom scanning options, you must make decisions about what VirusScan checks for during a scan. For example, you can determine whether VirusScan looks for unknown viruses, potentially unwanted programs, such as spyware or adware, stealth programs and rootkits (which can grant unauthorized access to your computer), and cookies that Web sites can use to track your behavior. You must also make decisions about the types of files that are checked. For example, you can determine whether VirusScan checks all files or just program files and documents (since that is where most viruses are detected). You can also determine whether archive files (for example, .zip files) are included in the scan.

By default, VirusScan checks all the drives and folders on your computer and all network drives each time it runs a custom scan; however, you can change the default locations to suit your needs. For example, you can scan only critical PC files, items on your desktop, or items in your Program Files folder. Unless you want to be responsible for initiating each custom scan yourself, you can set up a regular schedule for scans. Scheduled scans always check your entire computer using the default scan options. By default, VirusScan performs a scheduled scan once a week.

If you find that you are experiencing slow scan speeds, consider disabling the option to use minimal computer resources, but keep in mind that higher priority will be given to virus protection than to other tasks.

Note: When enjoying activities like watching movies, playing games on your computer, or any activity that occupies your entire computer screen, VirusScan pauses a number of tasks, including automatic updates and custom scans.

Set custom scan options

You set custom scan options to customize what VirusScan looks for during a custom scan as well as the locations and file types it scans. Options include scanning for unknown viruses, file archives, spyware and potentially unwanted programs, tracking cookies, rootkits, and stealth programs. You can also set the custom scan location to determine where VirusScan looks for viruses and other harmful items during a custom scan. You can scan all files, folders, and drives on your computer or you can restrict scanning to specific folders and drives.

1 Open the Custom Scan pane.

How?

1. Under **Common Tasks**, click **Home**.
 2. On the SecurityCenter Home pane, click **Computer & Files**.
 3. In the Computer & Files information area, click **Configure**.
 4. On the Computer & Files Configuration pane, ensure that virus protection is enabled, and click **Advanced**.
 5. Click **Custom Scan** in the Virus Protection pane.
- 2 Specify your custom scanning options, and then click **OK**.

| To... | Do this... |
|--|--|
| Detect unknown viruses and new variants of known viruses | Select Scan for unknown viruses . |
| Detect and remove viruses in .zip and other archive files | Select Scan archive files . |
| Detect spyware, adware, and other potentially unwanted programs | Select Scan for spyware and potential threats . |
| Detect cookies | Select Scan and remove tracking cookies . |
| Detect rootkits and stealth programs that can alter and exploit existing Windows system files | Select Scan for stealth programs . |
| Use less processor power for scans while giving higher priority to other tasks (such as Web browsing or opening documents) | Select Scan using minimal computer resources . |
| Specify which types of files to scan | Click either All files (recommended) or Program files and documents only . |

3. Click **Default Location to Scan** and then select or clear those locations you would like either to scan or to skip, and then click **OK**:

| To... | Do this... |
|---|---|
| Scan all the files and folders on your computer | Select (My) Computer . |
| Scan specific files, folders, and drives on your computer | Clear the (My) Computer check box, and select one or more folders or drives. |

| To... | Do this... |
|----------------------------|---|
| Scan critical system files | Clear the (My) Computer check box, and then select the Critical System Files check box. |

Scheduling a scan

Schedule scans to thoroughly check your computer for viruses and other threats any day and time of the week. Scheduled scans always check your entire computer using the default scan options. By default, VirusScan performs a scheduled scan once a week. If you find that you are experiencing slow scan speeds, consider disabling the option to use minimal computer resources, but keep in mind that higher priority will be given to virus protection than to other tasks.

Schedule scans that thoroughly check your entire computer for viruses and other threats using your default scan options. By default, VirusScan performs a scheduled scan once a week.

1 Open the Scheduled Scan pane.

How?

1. Under **Common Tasks**, click **Home**.
2. On the SecurityCenter Home pane, click **Computer & Files**.
3. In the Computer & Files information area, click **Configure**.
4. On the Computer & Files Configuration pane, ensure that virus protection is enabled, and click **Advanced**.
5. Click **Scheduled Scan** in the Virus Protection pane.

2 Select **Enable scheduled scanning**.

3 To reduce the amount of processor power normally used for scanning, select **Scan using minimal computer resources**.

4 Select one or more days.

5 Specify a start time.

6 Click **OK**.

Tip: You can restore the default schedule by clicking **Reset**.

Using SystemGuards options

SystemGuards monitor, log, report, and manage potentially unauthorized changes made to the Windows registry or critical system files on your computer. Unauthorized registry and file changes can harm your computer, compromise its security, and damage valuable system files.

Registry and files changes are common and occur regularly on your computer. Because many are harmless, SystemGuards' default settings are configured to provide reliable, intelligent, and real-world protection against unauthorized changes that pose significant potential for harm. For example, when SystemGuards detect changes that are uncommon and present a potentially significant threat, the activity is immediately reported and logged. Changes that are more common, but still pose some potential for damage, are logged only. However, monitoring for standard and low-risk changes is, by default, disabled. SystemGuards technology can be configured to extend its protection to any environment you like.

There are three types of SystemGuards: Program SystemGuards, Windows SystemGuards, and Browser SystemGuards.

Program SystemGuards

Program SystemGuards detect potentially unauthorized changes to your computer's registry and other critical files that are essential to Windows. These important registry items and files include ActiveX installations, startup items, Windows shell execute hooks, and shell service object delay loads. By monitoring these, Program SystemGuards technology stops suspect ActiveX programs (downloaded from the Internet) in addition to spyware and potentially unwanted programs that can automatically launch when Windows starts.

Windows SystemGuards

Windows SystemGuards also detect potentially unauthorized changes to your computer's registry and other critical files that are essential to Windows. These important registry items and files include context menu handlers, appInit DLLs, and the Windows hosts file. By monitoring these, Windows SystemGuards technology helps prevent your computer from sending and receiving unauthorized or personal information over the Internet. It also helps stop suspect programs that can bring unwanted changes to the appearance and behavior of the programs that are important to you and your family.

Browser SystemGuards

Like Program and Windows SystemGuards, Browser SystemGuards detect potentially unauthorized changes to your computer's registry and other critical files that are essential to Windows. Browser SystemGuards, however, monitor changes to important registry items and files like Internet Explorer add-ons, Internet Explorer URLs, and Internet Explorer security zones. By monitoring these, Browser SystemGuards technology helps prevent unauthorized browser activity such as redirection to suspect Web sites, changes to browser settings and options without your knowledge, and unwanted trusting of suspect Web sites.

Enable SystemGuards protection

Enable SystemGuards protection to detect and alert you to potentially unauthorized Windows registry and file changes on your computer. Unauthorized registry and file changes can harm your computer, compromise its security, and damage valuable system files.

- 1 Open the Computer & Files Configuration pane.

How?

1. On the left pane, click **Advanced Menu**.
2. Click **Configure**.
3. On the Configure pane, click **Computer & Files**.

- 2 Under **SystemGuard protection**, click **On**.

Note: You can disable SystemGuard protection, by clicking **Off**.

Configure SystemGuards options

Use the SystemGuards pane to configure protection, logging, and alerting options against unauthorized registry and file changes associated with Windows files, programs, and Internet Explorer. Unauthorized registry and file changes can harm your computer, compromise its security, and damage valuable system files.

- 1 Open the SystemGuards pane.
 1. Under **Common Tasks**, click **Home**.
 2. On the SecurityCenter Home pane, click **Computer & Files**.
 3. In the Computer & Files information area, click **Configure**.
 4. On the Computer & Files Configuration pane, ensure that SystemGuard protection is enabled, and click **Advanced**.
- 2 Select a SystemGuard type from the list.
 - **Program SystemGuards**
 - **Windows SystemGuards**

- **Browser SystemGuards**

3 Under **I want to**, do one of the following:

- To detect, log, and report unauthorized registry and file changes associated with Program, Windows, and Browsers SystemGuards, click **Show alerts**.
- To detect and log unauthorized registry and file changes associated with Program, Windows, and Browsers Systemguards, click **Only log changes**.
- To disable detection of unauthorized registry and file changes associated with Program, Windows, and Browser Systemguards, click **Disable the SystemGuard**.

Note: For more information about SystemGuards types, see About SystemGuards types (page 54).

About SystemGuards types

SystemGuards detect potentially unauthorized changes to your computer's registry and other critical files that are essential to Windows. There are three types of SystemGuards: Program SystemGuards, Windows SystemGuards, and Browser SystemGuards

Program SystemGuards

Program SystemGuards technology stops suspect ActiveX programs (downloaded from the Internet) in addition to spyware and potentially unwanted programs that can automatically launch when Windows starts.

| SystemGuard | Detects... |
|---------------------------------|---|
| ActiveX Installations | Unauthorized registry changes to ActiveX installations that can harm your computer, compromise its security, and damage valuable system files. |
| Startup Items | Spyware, adware, and other potentially unwanted programs that can install file changes to startup items, allowing suspect programs to run when you start your computer. |
| Windows Shell Execute Hooks | Spyware, adware, and other potentially unwanted programs that can install Windows shell execute hooks to prevent security programs from running properly. |
| Shell Service Object Delay Load | Spyware, adware, and other potentially unwanted programs that can make registry changes to the shell service object delay load, allowing harmful files to run when you start your computer. |

Windows SystemGuards

Windows SystemGuards technology helps prevent your computer from sending and receiving unauthorized or personal information over the Internet. It also helps stop suspect programs that can bring unwanted changes to the appearance and behavior of the programs that are important to you and your family.

| SystemGuard | Detects... |
|-----------------------------------|---|
| Context Menu Handlers | Unauthorized registry changes to Windows context menu handlers that can affect the appearance and behavior of Windows menus. Context menus allow you to perform actions on your computer, such as right-clicking files. |
| AppInit DLLs | Unauthorized registry changes to Windows appInit DLLs that can allow potentially harmful files to run when you start your computer. |
| Windows Hosts File | Spyware, adware, and potentially unwanted programs that can make unauthorized changes in your Windows hosts file, allowing your browser to be redirected to suspect Web sites and to block software updates. |
| Winlogon Shell | Spyware, adware, and other potentially unwanted programs that can make registry changes to the Winlogon shell, allowing other programs to replace Windows Explorer. |
| Winlogon User Init | Spyware, adware, and other potentially unwanted programs that can make registry changes to Winlogon user init, allowing suspect programs to run when you log on to Windows. |
| Windows Protocols | Spyware, adware, and other potentially unwanted programs that can make registry changes to Windows protocols, affecting how your computer sends and receives information on the Internet. |
| Winsock Layered Service Providers | Spyware, adware, and other potentially unwanted programs that can install registry changes to Winsock Layered Service Providers (LSPs) to intercept and change information you send and receive on the Internet. |
| Windows Shell Open Commands | Unauthorized changes to Windows shell open commands that can allow worms and other harmful programs to run on your computer. |
| Shared Task Scheduler | Spyware, adware, and other potentially unwanted programs that can make registry and file changes to the shared task scheduler, allowing potentially harmful files to run when you start your computer. |

| SystemGuard | Detects... |
|---------------------------|--|
| Windows Messenger Service | Spyware, adware, and other potentially unwanted programs that can make registry changes to the Windows messenger service, allowing unsolicited ads and remotely run programs on your computer. |
| Windows Win.ini File | Spyware, adware, and other potentially unwanted programs that can make changes to the Win.ini file, allowing suspect programs to run when you start your computer. |

Browser SystemGuards

Browser SystemGuards technology helps prevent unauthorized browser activity such as redirection to suspect Web sites, changes to browser settings and options without your knowledge, and unwanted trusting of suspect Web sites.

| SystemGuard | Detects... |
|------------------------------------|--|
| Browser Helper Objects | Spyware, adware, and other potentially unwanted programs that can use browser helper objects to track Web browsing and show unsolicited ads. |
| Internet Explorer Bars | Unauthorized registry changes to Internet Explorer Bar programs, such as Search and Favorites, that can affect the appearance and behavior of Internet Explorer. |
| Internet Explorer Add-ons | Spyware, adware, and other potentially unwanted programs that can install Internet Explorer add-ons to track Web browsing and show unsolicited ads. |
| Internet Explorer ShellBrowser | Unauthorized registry changes to the Internet Explorer shell browser that can affect the appearance and behavior of your Web browser. |
| Internet Explorer WebBrowser | Unauthorized registry changes to the Internet Explorer Web browser that can affect the appearance and behavior of your browser. |
| Internet Explorer URL Search Hooks | Spyware, adware, and other potentially unwanted programs that can make registry changes to Internet Explorer URL search hooks, allowing your browser to be redirected to suspect Web sites when searching the Web. |
| Internet Explorer URLs | Spyware, adware, and other potentially unwanted programs that can make registry changes to Internet Explorer URLs, affecting browser settings. |

| SystemGuard | Detects... |
|----------------------------------|--|
| Internet Explorer Restrictions | Spyware, adware, and other potentially unwanted programs that can make registry changes to Internet Explorer restrictions, affecting browser settings and options. |
| Internet Explorer Security Zones | Spyware, adware, and other potentially unwanted programs that can make registry changes to Internet Explorer security zones, allowing potentially harmful files to run when you start your computer. |
| Internet Explorer Trusted Sites | Spyware, adware, and other potentially unwanted programs that can make registry changes to Internet Explorer trusted sites, allowing your browser to trust suspect Web sites. |
| Internet Explorer Policy | Spyware, adware, and other potentially unwanted programs that can make registry changes to Internet Explorer policies, affecting the appearance and behavior of your browser. |

Using trusted lists

If VirusScan detects a file or registry change (SystemGuard), program, or buffer overflow, it prompts you to trust or remove it. If you trust the item and indicate that you do not want to receive future notification about its activity, the item is added to a trusted list and VirusScan no longer detects it or notifies you about its activity. If an item has been added to a trusted list, but you decide you want to block its activity, you can do so. Blocking prevents the item from running or making any changes to your computer without notifying you each time an attempt is made. You can also remove an item from a trusted list. Removing allows VirusScan to detect the item's activity again.

Manage trusted lists

Use the Trusted Lists pane to trust or block items that have been previously detected and trusted. You can also remove an item from a trusted list so that VirusScan detects it again.

- 1 Open the Trusted Lists pane.
 1. Under **Common Tasks**, click **Home**.
 2. On the SecurityCenter Home pane, click **Computer & Files**.
 3. In the Computer & Files information area, click **Configure**.
 4. On the Computer & Files Configuration pane, ensure that virus protection is enabled, and click **Advanced**.
 5. Click **Trusted Lists** in the Virus Protection pane.
- 2 Select one of the following trusted list types:
 - **Program SystemGuards**
 - **Windows SystemGuards**
 - **Browser SystemGuards**
 - **Trusted Programs**
 - **Trusted Buffer Overflows**
- 3 Under **I want to**, do one of the following:
 - To allow the detected item to make changes to the Windows registry or critical system files on your computer without notifying you, click **Trust**.
 - To block the detected item from making changes to the Windows registry or critical system files on your computer without notifying you, click **Block**.
 - To remove the detected item from the trusted lists, click **Remove**.

4 Click **OK**.

Note: For more information about trusted list types, see About trusted lists types (page 59).

About trusted lists types

SystemGuards on the Trusted Lists pane represent previously unauthorized registry and file changes that VirusScan has detected but that you have chosen to allow from an alert of from the Scan results pane. There are five types of trusted list types that you can manage on the Trusted Lists pane: Program SystemGuards, Windows SystemGuards, Browser SystemGuards, Trusted Programs, and Trusted Buffer Overflows.

| Option | Description |
|----------------------|--|
| Program SystemGuards | <p>Program SystemGuards on the Trusted Lists pane represent previously unauthorized registry and file changes that VirusScan has detected, but that you have chosen to allow from an alert or from the Scan Results pane.</p> <p>Program SystemGuards detect unauthorized registry and file changes associated with ActiveX installations, startup items, Windows shell execute hooks, and shell service object delay load activity. These types of unauthorized registry and file changes can harm your computer, compromise its security, and damage valuable system files.</p> |
| Windows SystemGuards | <p>Windows SystemGuards on the Trusted Lists pane represent previously unauthorized registry and file changes that VirusScan has detected, but that you have chosen to allow from an alert or from the Scan Results pane.</p> <p>Windows SystemGuards detect unauthorized registry and file changes associated with context menu handlers, appInit DLLs, the Windows hosts file, the Winlogon shell, Winsock Layered Service Providers (LSPs), and so on. These types of unauthorized registry and file changes can affect how your computer sends and receives information over the Internet, change the appearance and behavior of programs, and allow suspect programs to run on your computer.</p> |

| Option | Description |
|--------------------------|---|
| Browser SystemGuards | <p>Browser SystemGuards on the Trusted Lists pane represent previously unauthorized registry and file changes that VirusScan has detected, but that you have chosen to allow from an alert or from the Scan Results pane.</p> <p>Browser SystemGuards detect unauthorized registry changes and other unwanted behavior associated with Browser helper objects, Internet Explorer add-ons, Internet Explorer URLs, Internet Explorer security zones, and so on. These types of unauthorized registry changes can result in unwanted browser activity such as redirection to suspect Web sites, changes to browser settings and options, and trusting of suspect Web sites.</p> |
| Trusted Programs | <p>Trusted programs are potentially unwanted programs that VirusScan has previously detected, but which you have chosen to trust from an alert or from the Scan Results pane.</p> |
| Trusted Buffer Overflows | <p>Trusted buffer overflows represent previously unwanted activity that VirusScan has detected, but which you have chosen to trust from an alert or from the Scan Results pane.</p> <p>Buffer overflows can harm your computer and damage files. Buffer overflows occur when the amount of information suspect programs or processes store in a buffer exceeds the buffer's capacity.</p> |

CHAPTER 12

McAfee Personal Firewall

Personal Firewall offers advanced protection for your computer and your personal data. Personal Firewall establishes a barrier between your computer and the Internet, silently monitoring Internet traffic for suspicious activities.

Note: SecurityCenter reports critical and non-critical protection problems as soon as it detects them. If you need help diagnosing your protection problems, you can run McAfee Virtual Technician.

| Managing system services | 97 |
| Logging, monitoring, and analysis..... | 103 |
| Learning about Internet security | 113 |

Personal Firewall features

| | |
|---|---|
| Standard and custom protection levels | Guard against intrusion and suspicious activity using Firewall's default or customizable protection settings. |
| Real-time recommendations | Receive recommendations, dynamically, to help you decide whether programs should be allowed Internet access or network traffic should be trusted. |
| Intelligent access management for programs | Manage Internet access for programs, through alerts and event logs, and configure access permissions for specific programs. |
| Gaming protection | Prevent alerts regarding intrusion attempts and suspicious activities from distracting you during full-screen gameplay. |
| Computer startup protection | Protect your computer from intrusion attempts, unwanted programs and network traffic as soon as Windows® starts. |
| System service port control | Manage open and closed system service ports required by some programs. |
| Manage computer connections | Allow and block remote connections between other computers and your computer. |
| HackerWatch information integration | Track global hacking and intrusion patterns through HackerWatch's Web site, which also provides current security information about programs on your computer, as well as global security events and Internet port statistics. |
| Lockdown Firewall | Block all inbound and outbound traffic instantly between your computer and the Internet. |
| Restore Firewall | Restore Firewall's original protection settings instantly. |
| Advanced Trojan detection | Detect and block potentially malicious applications, such as Trojans, from sending your personal data to the Internet. |
| Event logging | Track recent inbound, outbound, and intrusion events. |
| Monitor Internet traffic | Review worldwide maps showing the source of hostile attacks and traffic. In addition, locate detailed owner information and geographical data for originating IP addresses. Also, analyze inbound and outbound traffic, monitor program bandwidth and program activity. |
| Intrusion prevention | Protect your privacy from possible Internet threats. Using heuristic-like functionality, we provide a tertiary layer of protection by blocking items that display symptoms of attacks or characteristics of hacking attempts. |
| Sophisticated traffic analysis | Review both inbound and outbound Internet traffic and program connections, including those that are actively listening for open connections. This allows you to see and act upon programs that can be vulnerable to intrusion. |

CHAPTER 13

Starting Firewall

As soon as you install Firewall, your computer is protected from intrusion and unwanted network traffic. In addition, you are ready to handle alerts and manage inbound and outbound Internet access for known and unknown programs. Smart Recommendations and Automatic security level (with the option selected to allow programs outgoing-only Internet access) are automatically enabled.

Although you can disable Firewall from the Internet & Network Configuration pane, your computer will no longer be protected from intrusion and unwanted network traffic, and you will be unable to effectively manage inbound and outbound Internet connections. If you must disable firewall protection, do so temporarily and only when necessary. You can also enable Firewall from the Internet & Network Configuration panel.

Firewall automatically disables Windows® Firewall and sets itself as your default firewall.

Note: To configure Firewall, open the Internet & Network Configuration pane.

In this chapter

| | |
|---------------------------------|----|
| Start firewall protection | 63 |
| Stop firewall protection | 64 |

Start firewall protection

You can enable Firewall to protect your computer from intrusion and unwanted network traffic, as well as manage inbound and outbound Internet connections.

- 1 On the McAfee SecurityCenter pane, click **Internet & Network**, and then click **Configure**.
- 2 On the Internet & Network Configuration pane, under **Firewall protection is disabled**, click **On**.

Stop firewall protection

You can disable Firewall if you do not want to protect your computer from intrusion and unwanted network traffic. When Firewall is disabled, you cannot manage inbound or outbound Internet connections.

- 1 On the McAfee SecurityCenter pane, click **Internet & Network**, and then click **Configure**.
- 2 On the Internet & Network Configuration pane, under **Firewall protection is enabled**, click **Off**.

CHAPTER 14

Working with alerts

Firewall employs an array of alerts to help you manage your security. These alerts can be grouped into three basic types:

- Red alert
- Yellow alert
- Green alert

Alerts can also contain information to help you decide how to handle alerts or get information about programs running on your computer.

In this chapter

About alerts..... 66

About alerts

Firewall has three basic alert types. As well, some alerts include information to help you learn or get information about programs running on your computer.

Red alert

A red alert appears when Firewall detects, then blocks, a Trojan on your computer, and recommends that you scan for additional threats. A Trojan appears to be a legitimate program, but can disrupt, damage, and provide unauthorized access to your computer. This alert occurs in every security level.

Yellow alert

The most common type of alert is a yellow alert, which informs you about a program activity or network event detected by Firewall. When this occurs, the alert describes the program activity or network event, and then provides you with one or more options that require your response. For example, the **New Network Connection** alert appears when a computer with Firewall installed is connected to a new network. You can specify the level of trust that you want to assign to this new network, and it then appears in your Networks list. If Smart Recommendations is enabled, known programs are automatically added to the Program Permissions pane.

Green alert

In most cases, a green alert provides basic information about an event and does not require a response. Green alerts are disabled by default.

User Assistance

Many Firewall alerts contain additional information to help you manage your computer's security, which includes the following:

- **Learn more about this program:** Launch McAfee's global security Web site to get information about a program that Firewall has detected on your computer.
- **Tell McAfee about this program:** Send information to McAfee about an unknown file that Firewall has detected on your computer.
- **McAfee recommends:** Advice about handling alerts. For example, an alert can recommend that you allow access for a program.

CHAPTER 15

Managing informational alerts

Firewall allows you to display or hide informational alerts when it detects intrusion attempts or suspicious activity during certain events, for example, during full-screen gameplay.

In this chapter

| | |
|----------------------------------|----|
| Display alerts while gaming..... | 67 |
| Hide informational alerts | 67 |

Display alerts while gaming

You can allow Firewall informational alerts to be displayed when it detects intrusion attempts or suspicious activity during full-screen gameplay.

- 1 On the McAfee SecurityCenter pane, click **Advanced Menu**.
- 2 Click **Configure**.
- 3 On the SecurityCenter Configuration pane, under **Alerts**, click **Advanced**.
- 4 On the Alert Options pane, select **Show informational alerts when gaming mode is detected**.
- 5 Click **OK**.

Hide informational alerts

You can prevent Firewall informational alerts from being displayed when it detects intrusion attempts or suspicious activity.

- 1 On the McAfee SecurityCenter pane, click **Advanced Menu**.
- 2 Click **Configure**.
- 3 On the SecurityCenter Configuration pane, under **Alerts**, click **Advanced**.
- 4 On the SecurityCenter Configuration pane, click **Informational Alerts**.
- 5 On the Informational Alerts pane, do one of the following:
 - Select **Do not show informational alerts** to hide all informational alerts.
 - Clear an alert to hide.
- 6 Click **OK**.

CHAPTER 16

Configuring Firewall protection

Firewall offers a number of methods to manage your security and to tailor the way you want to respond to security events and alerts.

After you install Firewall for the first time, your computer's protection security level is set to Automatic and your programs are allowed outgoing-only Internet access. However, Firewall provides other levels, ranging from highly restrictive to highly permissive.

Firewall also offers you the opportunity to receive recommendations on alerts and Internet access for programs.

In this chapter

| | |
|--|----|
| Managing Firewall security levels | 70 |
| Configuring Smart Recommendations for alerts | 73 |
| Optimizing Firewall security | 75 |
| Locking and restoring Firewall..... | 78 |

Managing Firewall security levels

Firewall's security levels control the degree to which you want to manage and respond to alerts. These alerts appear when it detects unwanted network traffic and inbound and outbound Internet connections. By default, Firewall's security level is set to Automatic, with outgoing-only access.

When Automatic security level is set and Smart Recommendations is enabled, yellow alerts provide the option to either allow or block access for unknown programs that require inbound access. Although green alerts are disabled by default, they appear when known programs are detected and access is automatically allowed. Allowing access lets a program create outbound connections and listen for unsolicited inbound connections.

Generally, the more restrictive a security level (Stealth and Standard), the greater the number of options and alerts that are displayed and which, in turn, must be handled by you.

The following table describes Firewall's three security levels, starting from the most restrictive to the least:

| Level | Description |
|-----------|--|
| Stealth | Blocks all inbound Internet connections, except open ports, hiding your computer's presence on the Internet. The firewall alerts you when new programs attempt outbound Internet connections or receive inbound connection requests. Blocked and added programs appear on the Program Permissions pane. |
| Standard | Monitors inbound and outbound connections and alerts you when new programs attempt Internet access. Blocked and added programs appear on the Program Permissions pane. |
| Automatic | Allows programs to have either incoming and outgoing (full) or outgoing-only Internet access. The default security level is Automatic with the option selected to allow programs outgoing-only access. If a program is allowed full access, then Firewall automatically trusts it and adds it to the list of allowed programs on the Program Permissions pane. If a program is allowed outgoing-only access, then Firewall automatically trusts it when making an outbound Internet connection only. An inbound connection is not automatically trusted. |

Firewall also allows you to immediately reset your security level to Automatic (and allow outgoing-only access) from the Restore Firewall Defaults pane.

Set security level to Stealth

You can set the Firewall security level to Stealth to block all inbound network connections, except open ports, to hide your computer's presence on the Internet.

- 1 On the McAfee SecurityCenter pane, click **Internet & Network**, then click **Configure**.
- 2 On the Internet & Network Configuration pane, under **Firewall protection is enabled**, click **Advanced**.
- 3 On the Security Level pane, move the slider so that **Stealth** displays as the current level.
- 4 Click **OK**.

Note: In Stealth mode, Firewall alerts you when new programs request outbound Internet connection or receive inbound connection requests.

Set security level to Standard

You can set the security level to Standard to monitor inbound and outbound connections and alert you when new programs attempt Internet access.

- 1 On the McAfee SecurityCenter pane, click **Internet & Network**, then click **Configure**.
- 2 On the Internet & Network Configuration pane, under **Firewall protection is enabled**, click **Advanced**.
- 3 On the Security Level pane, move the slider so that **Standard** displays as the current level.
- 4 Click **OK**.

Set security level to Automatic

You can set Firewall's security level to Automatic to allow either full access or outbound-only network access.

- 1 On the McAfee SecurityCenter pane, click **Internet & Network**, then click **Configure**.
- 2 On the Internet & Network Configuration pane, under **Firewall protection is enabled**, click **Advanced**.
- 3 On the Security Level pane, move the slider so that **Automatic** displays as the current level.
- 4 Do one of the following:
 - To allow full inbound and outbound network access, select **Allow Full Access**.
 - To allow outbound-only network access, select **Allow Outgoing-Only Access**.

5 Click **OK**.

Note: The **Allow Outgoing-Only Access** is the default option.

Configuring Smart Recommendations for alerts

You can configure Firewall to include, exclude, or display recommendations in alerts when any programs try to access the Internet. Enabling Smart Recommendations helps you decide how to handle alerts.

When Smart Recommendations is applied (and the security level is set to Automatic with outgoing-only access enabled), Firewall automatically allows known programs, and blocks potentially dangerous programs.

When Smart Recommendations is not applied, Firewall neither allows or blocks Internet access, nor provides a recommendation in the alert.

When Smart Recommendations is set to Show, an alert prompts you to allow or block access, and Firewall provides a recommendation in the alert.

Enable Smart Recommendations

You can enable Smart Recommendations for Firewall to automatically allow or block programs, and alert you about unrecognized and potentially dangerous programs.

- 1 On the McAfee SecurityCenter pane, click **Internet & Network**, then click **Configure**.
- 2 On the Internet & Network Configuration pane, under **Firewall protection is enabled**, click **Advanced**.
- 3 On the Security Level pane, under **Smart Recommendations**, select **Apply Smart Recommendations**.
- 4 Click **OK**.

Disable Smart Recommendations

You can disable Smart Recommendations for Firewall to allow or block programs, and alert you about unrecognized and potentially dangerous programs. However, the alerts exclude any recommendations about handling access for programs. If Firewall detects a new program that is suspicious or is known to be a possible threat, it automatically blocks the program from accessing the Internet.

- 1 On the McAfee SecurityCenter pane, click **Internet & Network**, then click **Configure**.
- 2 On the Internet & Network Configuration pane, under **Firewall protection is enabled**, click **Advanced**.
- 3 On the Security Level pane, under **Smart Recommendations**, select **Don't apply Smart Recommendations**.
- 4 Click **OK**.

Display Smart Recommendations

You can display Smart Recommendations to display only a recommendation in the alerts so that you decide whether to allow or block unrecognized and potentially dangerous programs.

- 1 On the McAfee SecurityCenter pane, click **Internet & Network**, then click **Configure**.
- 2 On the Internet & Network Configuration pane, under **Firewall protection is enabled**, click **Advanced**.
- 3 On the Security Level pane, under **Smart Recommendations**, select **Show Smart Recommendations**.
- 4 Click **OK**.

Optimizing Firewall security

The security of your computer can be compromised in many ways. For example, some programs can attempt to connect to the Internet as Windows® starts up. Also, sophisticated computer users can trace (or ping) your computer to determine whether it is connected to a network. As well, they can send information to your computer, using the UDP protocol, in the form of message units (datagrams). Firewall defends your computer against these types of intrusion by allowing you to block programs from accessing the Internet as Windows starts, allowing you to block ping requests that help other users detect your computer on a network, and allowing you to disable other users from sending information to your computer in the form of message units (datagrams).

Standard installation settings include automatic detection for the most common intrusion attempts, such as Denial of Service attacks or exploits. Using the standard installation settings ensures that you are protected against these attacks and scans; however, you can disable automatic detection for one or more attacks or scans on the Intrusion Detection pane.

Protect your computer during startup

You can protect your computer as Windows starts up to block new programs that did not have, and now need, Internet access during startup. Firewall displays relevant alerts for programs that had requested Internet access, which you can allow or block.

- 1 On the McAfee SecurityCenter pane, click **Internet & Network**, then click **Configure**.
- 2 On the Internet & Network Configuration pane, under **Firewall protection is enabled**, click **Advanced**.
- 3 On the Security Level pane, under **Security Settings**, select **Enable protection during Windows startup**.
- 4 Click **OK**.

Note: Blocked connections and intrusions are not logged while startup protection is enabled.

Configure ping request settings

You can allow or prevent detection of your computer on the network by other computer users.

- 1 On the McAfee SecurityCenter pane, click **Internet & Network**, then click **Configure**.
- 2 On the Internet & Network Configuration pane, under **Firewall protection is enabled**, click **Advanced**.
- 3 On the Security Level pane, under **Security Settings**, do one of the following:
 - Select **Allow ICMP ping requests** to allow detection of your computer on the network using ping requests.
 - Clear **Allow ICMP ping requests** to prevent detection of your computer on the network using ping requests.
- 4 Click **OK**.

Configure UDP settings

You can allow other network computer users to send message units (datagrams) to your computer, using the UDP protocol. However, you can do this only if you also have closed a system service port to block this protocol.

- 1 On the McAfee SecurityCenter pane, click **Internet & Network**, then click **Configure**.
- 2 On the Internet & Network Configuration pane, under **Firewall protection is enabled**, click **Advanced**.
- 3 On the Security Level pane, under **Security Settings**, do one of the following:
 - Select **Enable UDP tracking** to allow other computer users to send message units (datagrams) to your computer.
 - Clear **Enable UDP tracking** to prevent other computer users from sending message units (datagrams) to your computer.
- 4 Click **OK**.

Configure intrusion detection

You can detect intrusion attempts to protect your computer from attacks and unauthorized scans. The standard Firewall setting includes automatic detection for the most common intrusion attempts, such as Denial of Service attacks or exploits; however, you can disable automatic detection for one or more attacks or scans.

- 1 On the McAfee SecurityCenter pane, click **Internet & Network**, then click **Configure**.
- 2 On the Internet & Network Configuration pane, under **Firewall protection is enabled**, click **Advanced**.
- 3 On the Firewall pane, click **Intrusion Detection**.
- 4 Under **Detect Intrusion Attempts**, do one of the following:
 - Select a name to automatically detect the attack or scan.
 - Clear a name to disable automatic detection of the attack or scan.
- 5 Click **OK**.

Configure Firewall Protection Status settings

You can configure Firewall to ignore that specific problems on your computer are not reported to the SecurityCenter.

- 1 On the McAfee SecurityCenter pane, under **SecurityCenter Information**, click **Configure**.
- 2 On the SecurityCenter Configuration pane, under **Protection Status**, click **Advanced**.
- 3 On the Ignored Problems pane, select one or more of the following options:
 - **Firewall protection is disabled.**
 - **Firewall service is not running.**
 - **Firewall Protection is not installed on your computer.**
 - **Your Windows Firewall is disabled.**
 - **Outbound firewall is not installed on your computer.**
- 4 Click **OK**.

Locking and restoring Firewall

Lockdown instantly blocks all inbound and outbound network connections, including access to Web sites, e-mail, and security updates. Lockdown has the same result as disconnecting the network cables on your computer. You can use this setting to block open ports on the System Services pane and to help you isolate and troubleshoot a problem on your computer.

Lockdown Firewall instantly

You can lockdown Firewall to instantly block all network traffic between your computer and any network, including the Internet.

- 1 On the McAfee SecurityCenter pane, under **Common Tasks**, click **Lockdown Firewall**.
- 2 On the Lockdown Firewall pane, click **Enable Firewall Lockdown**.
- 3 Click **Yes** to confirm.

Tip: You can also lockdown Firewall by right-clicking the SecurityCenter icon  in the notification area at the far right of your taskbar, clicking **Quick Links**, and then clicking **Lockdown Firewall**.

Unlock Firewall instantly

You can unlock Firewall to instantly allow all network traffic between your computer and any network, including the Internet.

- 1 On the McAfee SecurityCenter pane, under **Common Tasks**, click **Lockdown Firewall**.
- 2 On the Lockdown Enabled pane, click **Disable Firewall Lockdown**.
- 3 Click **Yes** to confirm.

Restore Firewall settings

You can quickly restore Firewall to its original protection settings. This resets your security level to Automatic and allows outgoing-only network access, enables Smart Recommendations, restores the list of default programs and their permissions in the Program Permissions pane, removes trusted and banned IP addresses, and restores system services, event log settings, and intrusion detection.

- 1 On the McAfee SecurityCenter pane, click **Restore Firewall Defaults**.
- 2 On the Restore Firewall Protection Defaults pane, click **Restore Defaults**.
- 3 Click **Yes** to confirm.
- 4 Click **OK**.

CHAPTER 17

Managing programs and permissions

Firewall allows you to manage and create access permissions for existing and new programs that require inbound and outbound Internet access. Firewall lets you control full or outbound-only access for programs. You can also block access for programs.

In this chapter

| | |
|--|----|
| Allowing Internet access for programs | 82 |
| Allowing outbound-only access for programs | 84 |
| Blocking Internet access for programs | 85 |
| Removing access permissions for programs | 87 |
| Learning about programs | 88 |

Allowing Internet access for programs

Some programs, like Internet browsers, need to access the Internet to function properly.

Firewall allows you use the Program Permissions page to:

- Allow access for programs
- Allow outbound-only access for programs
- Block access for programs

You can also allow a program to have full and outbound-only Internet access from the Outbound Events and Recent Events log.

Allow full access for a program

You can allow an existing blocked program on your computer to have full inbound and outbound Internet access.

- 1 On the McAfee SecurityCenter pane, click **Internet & Network**, then click **Configure**.
- 2 On the Internet & Network Configuration pane, under **Firewall protection is enabled**, click **Advanced**.
- 3 On the Firewall pane, click **Program Permissions**.
- 4 Under **Program Permissions**, select a program with **Blocked** or **Outbound-Only Access**.
- 5 Under **Action**, click **Allow Access**.
- 6 Click **OK**.

Allow full access for a new program

You can allow a new program on your computer to have full inbound and outbound Internet access.

- 1 On the McAfee SecurityCenter pane, click **Internet & Network**, then click **Configure**.
- 2 On the Internet & Network Configuration pane, under **Firewall protection is enabled**, click **Advanced**.
- 3 On the Firewall pane, click **Program Permissions**.
- 4 Under **Program Permissions**, click **Add Allowed Program**.
- 5 In the **Add Program** dialog box, browse for and select the program that you want to add, then click **Open**.

Note: You can change the permissions of a newly added program as you would an existing program by selecting the program, and then clicking **Allow Outbound-Only Access** or **Block Access** under **Action**.

Allow full access from the Recent Events log

You can allow an existing blocked program that appears in the Recent Events log to have full inbound and outbound Internet access.

- 1 On the McAfee SecurityCenter pane, click **Advanced Menu**.
- 2 Click **Reports & Logs**.
- 3 Under **Recent Events**, select the event description, and then click **Allow Access**.
- 4 In the Program Permissions dialog, click **Yes** to confirm.

Related topics

- View outbound events (page 105)

Allow full access from the Outbound Events log

You can allow an existing blocked program that appears in the Outbound Events log to have full inbound and outbound Internet access.

- 1 On the McAfee SecurityCenter pane, click **Advanced Menu**.
- 2 Click **Reports & Logs**.
- 3 Under **Recent Events**, click **View Log**.
- 4 Click **Internet & Network**, and then click **Outbound Events**.
- 5 Select a program, and under **I want to**, click **Allow Access**.
- 6 In the Program Permissions dialog, click **Yes** to confirm.

Allowing outbound-only access for programs

Some programs on your computer require outbound Internet access. Firewall lets you configure program permissions to allow outbound-only Internet access.

Allow outbound-only access for a program

You can allow a program to have outbound-only Internet access.

- 1 On the McAfee SecurityCenter pane, click **Internet & Network**, then click **Configure**.
- 2 On the Internet & Network Configuration pane, under **Firewall protection is enabled**, click **Advanced**.
- 3 On the Firewall pane, click **Program Permissions**.
- 4 Under **Program Permissions**, select a program with **Blocked** or **Full Access**.
- 5 Under **Action**, click **Allow Outbound-Only Access**.
- 6 Click **OK**.

Allow outbound-only access from the Recent Events log

You can allow an existing blocked program that appears in the Recent Events log to have outbound-only Internet access.

- 1 On the McAfee SecurityCenter pane, click **Advanced Menu**.
- 2 Click **Reports & Logs**.
- 3 Under **Recent Events**, select the event description, and then click **Allow Outbound-Only Access**.
- 4 In the Program Permissions dialog, click **Yes** to confirm.

Allow outbound-only access from the Outbound Events log

You can allow an existing blocked program that appears in the Outbound Events log to have outbound-only Internet access.

- 1 On the McAfee SecurityCenter pane, click **Advanced Menu**.
- 2 Click **Reports & Logs**.
- 3 Under **Recent Events**, click **View Log**.
- 4 Click **Internet & Network**, and then click **Outbound Events**.
- 5 Select a program, and under **I want to**, click **Allow Outbound-Only Access**.
- 6 In the Program Permissions dialog, click **Yes** to confirm.

Blocking Internet access for programs

Firewall allows you to block programs from accessing the Internet. Ensure that blocking a program will not interrupt with your network connection or another program that requires access to the Internet to function properly.

Block access for a program

You can block a program from having inbound and outbound Internet access.

- 1 On the McAfee SecurityCenter pane, click **Internet & Network**, then click **Configure**.
- 2 On the Internet & Network Configuration pane, under **Firewall protection is enabled**, click **Advanced**.
- 3 On the Firewall pane, click **Program Permissions**.
- 4 Under **Program Permissions**, select a program with **Full Access** or **Outbound-Only Access**.
- 5 Under **Action**, click **Block Access**.
- 6 Click **OK**.

Block access for a new program

You can block a new program from having inbound and outbound Internet access.

- 1 On the McAfee SecurityCenter pane, click **Internet & Network**, then click **Configure**.
- 2 On the Internet & Network Configuration pane, under **Firewall protection is enabled**, click **Advanced**.
- 3 On the Firewall pane, click **Program Permissions**.
- 4 Under **Program Permissions**, click **Add Blocked Program**.
- 5 On the Add Program dialog, browse for an select the program that you want to add, and then click **Open**.

Note: You can change the permissions of a newly added program by selecting the program and then clicking **Allow Outbound-Only Access** or **Allow Access** under **Action**.

Block access from the Recent Events log

You can block a program that appears in the Recent Events log from having inbound and outbound Internet access.

- 1 On the McAfee SecurityCenter pane, click **Advanced Menu**.
- 2 Click **Reports & Logs**.
- 3 Under **Recent Events**, select the event description, and then click **Block Access**.
- 4 In the Program Permissions dialog, click **Yes** to confirm.

Removing access permissions for programs

Before removing a program permission, ensure that its absence does not affect your computer's functionality or your network connection.

Remove a program permission

You can remove a program from having any inbound or outbound Internet access.

- 1 On the McAfee SecurityCenter pane, click **Internet & Network**, then click **Configure**.
- 2 On the Internet & Network Configuration pane, under **Firewall protection is enabled**, click **Advanced**.
- 3 On the Firewall pane, click **Program Permissions**.
- 4 Under **Program Permissions**, select a program.
- 5 Under **Action**, click **Remove Program Permission**.
- 6 Click **OK**.

Note: Firewall prevents you from modifying some programs by dimming and disabling certain actions.

Learning about programs

If you are unsure which program permission to apply, you can get information about the program on McAfee's HackerWatch Web site.

Get program information

You can get program information from McAfee's HackerWatch Web site to decide whether to allow or block inbound and outbound Internet access.

Note: Ensure that you are connected to the Internet so that your browser launches McAfee's HackerWatch Web site, which provides up-to-date information about programs, Internet access requirements, and security threats.

- 1 On the McAfee SecurityCenter pane, click **Internet & Network**, then click **Configure**.
- 2 On the Internet & Network Configuration pane, under **Firewall protection is enabled**, click **Advanced**.
- 3 On the Firewall pane, click **Program Permissions**.
- 4 Under **Program Permissions**, select a program.
- 5 Under **Action**, click **Learn More**.

Get program information from the Outbound Events log

From the Outbound Events log, you can get program information from McAfee's HackerWatch Web site to decide which programs to allow or block inbound and outbound Internet access.

Note: Ensure that you are connected to the Internet so that your browser launches McAfee's HackerWatch Web site, which provides up-to-date information about programs, Internet access requirements, and security threats.

- 1 On the McAfee SecurityCenter pane, click **Advanced Menu**.
- 2 Click **Reports & Logs**.
- 3 Under Recent Events, select an event, and then click **View Log**.
- 4 Click **Internet & Network**, and then click **Outbound Events**.
- 5 Select an IP address, and then click **Learn more**.

CHAPTER 18

Managing computer connections

You can configure Firewall to manage specific remote connections to your computer by creating rules, based on Internet Protocol addresses (IPs), that are associated with remote computers. Computers that are associated with trusted IP addresses can be trusted to connect to your computer and those IPs that are unknown, suspicious, or distrusted, can be banned from connecting to your computer.

When allowing a connection, make sure that the computer that you trust is safe. If a trusted computer is infected with a worm or other mechanism, your computer can be vulnerable to infection. Also, McAfee recommends that the computer you trust is protected by a firewall and an up-to-date antivirus program. Firewall does not log traffic or generate event alerts from trusted IP addresses in the **Networks** list.

You can ban computers that are associated with unknown, suspicious, or distrusted IP addresses from connecting to your computer.

Since Firewall blocks all unwanted traffic, it is normally not necessary to ban an IP address. You should ban an IP address only when you are sure that an Internet connection is a threat. Make sure that you do not block important IP addresses, such as your DNS or DHCP server, or other ISP-related servers.

In this chapter

| | |
|------------------------------------|----|
| About computer connections | 90 |
| Banning computer connections | 94 |

About computer connections

Computer connections are the connections that you create between other computers on any network and yours. You can add, edit, and remove IP addresses on the **Networks** list. These IP addresses are associated with networks for which you want to assign a level of trust when connecting to your computer: Trusted, Standard, and Public.

| Level | Description |
|-----------------|---|
| Trusted | Firewall allows traffic from an IP to reach your computer through any port. Activity between the computer associated with a Trusted IP address and your computer is not filtered or analyzed by Firewall. By default, the first private network that Firewall finds is listed as Trusted in the Networks list. An example of a Trusted network is a computer or computers in your local or home network. |
| Standard | Firewall controls traffic from an IP (but not from any other computer in that network) when it connects to your computer, and allows or blocks it according to the rules in the System Services list. Firewall logs traffic and generates event alerts from Standard IP addresses. An example of a Standard network is a computer or computers in a corporate network. |
| Public | Firewall controls traffic from a public network according to the rules in the System Services list. An example of Public is an Internet network in a cafe, hotel, or airport. |

When allowing a connection, make sure that the computer that you trust is safe. If a trusted computer is infected with a worm or other mechanism, your computer can be vulnerable to infection. Also, McAfee recommends that the computer you trust is protected by a firewall and an up-to-date antivirus program.

Add a computer connection

You can add a trusted, standard, or public computer connection and its associated IP address.

- 1 On the McAfee SecurityCenter pane, click **Internet & Network**, then click **Configure**.
- 2 On the Internet & Network Configuration pane, under **Firewall protection is enabled**, click **Advanced**.
- 3 On the Firewall pane, click **Networks**.
- 4 On the Networks pane, click **Add**.
- 5 If the computer connection is on an IPv6 network, select the **IPv6** check box.
- 6 Under **Add Rule**, do one of the following:
 - Select **Single**, and then enter the IP address in the **IP Address** box.

- Select **Range**, and then enter the starting and ending IP addresses in the **From IP Address** and **To IP Address** boxes. If your computer connection is on an IPv6 network, enter the starting IP address and the prefix length in the **From IP Address** and **Prefix Length** boxes.
- 7 Under **Type**, do one of the following:
 - Select **Trusted** to specify that this computer connection is trusted (for example, a computer in a home network).
 - Select **Standard** to specify that this computer connection (and not the other computers in its network) is trusted (for example, a computer in a corporate network).
 - Select **Public** to specify that this computer connection is public (for example, a computer in an Internet café, hotel, or airport).
 - 8 If a system service uses Internet Connection Sharing (ICS), you can add the following IP address range: 192.168.0.1 to 192.168.0.255.
 - 9 Optionally, select **Rule expires in**, and enter the number of days to enforce the rule.
 - 10 Optionally, type a description for the rule.
 - 11 Click **OK**.

Note: For more information about Internet Connection Sharing (ICS), see Configure a new system service.

[Add a computer from the Inbound Events log](#)

You can add a trusted or standard computer connection and its associated IP address from the Inbound Events log.

- 1 On the McAfee SecurityCenter pane, on the Common Tasks pane, click **Advanced Menu**.
- 2 Click **Reports & Logs**.
- 3 Under **Recent Events**, click **View Log**.
- 4 Click **Internet & Network**, and then click **Inbound Events**.
- 5 Select a source IP address, and under **I want to**, do one of the following:
 - Click **Add this IP as Trusted** to add this computer as Trusted in your **Networks** list.
 - Click **Add this IP as Standard** to add this computer connection as Standard in your **Networks** list.
- 6 Click **Yes** to confirm.

Edit a computer connection

You can edit a trusted, standard, or public computer connection and its associated IP address.

- 1 On the McAfee SecurityCenter pane, click **Internet & Network**, then click **Configure**.
- 2 On the Internet & Network Configuration pane, under **Firewall protection is enabled**, click **Advanced**.
- 3 On the Firewall pane, click **Networks**.
- 4 On the Networks pane, select an IP address, and then click **Edit**.
- 5 If the computer connection is on an IPv6 network, select the **IPv6** check box.
- 6 Under **Edit Rule**, do one of the following:
 - Select **Single**, and then enter the IP address in the **IP Address** box.
 - Select **Range**, and then enter the starting and ending IP addresses in the **From IP Address** and **To IP Address** boxes. If your computer connection is on an IPv6 network, enter the starting IP address and the prefix length in the **From IP Address** and **Prefix Length** boxes.
- 7 Under **Type**, do one of the following:
 - Select **Trusted** to specify that this computer connection is trusted (for example, a computer in a home network).
 - Select **Standard** to specify that this computer connection (and not the other computers in its network) is trusted (for example, a computer in a corporate network).
 - Select **Public** to specify that this computer connection is public (for example, a computer in an Internet café, hotel, or airport).
- 8 Optionally, check **Rule expires in**, and enter the number of days to enforce the rule.
- 9 Optionally, type a description for the rule.
- 10 Click **OK**.

Note: You cannot edit the default computer connection that Firewall automatically added from a trusting private network.

Remove a computer connection

You can remove a trusted, standard, or public computer connection and its associated IP address.

- 1 On the McAfee SecurityCenter pane, click **Internet & Network**, then click **Configure**.
- 2 On the Internet & Network Configuration pane, under **Firewall protection is enabled**, click **Advanced**.
- 3 On the Firewall pane, click **Networks**.
- 4 On the Networks pane, select an IP address, and then click **Remove**.
- 5 Click **Yes** to confirm.

Banning computer connections

You can add, edit, and remove banned IP addresses in the Banned IPs pane.

You can ban computers that are associated with unknown, suspicious, or distrusted IP addresses from connecting to your computer.

Since Firewall blocks all unwanted traffic, it is normally not necessary to ban an IP address. You should ban an IP address only when you are sure that an Internet connection is a threat. Make sure that you do not block important IP addresses, such as your DNS or DHCP server, or other ISP-related servers.

Add a banned computer connection

You can add a banned computer connection and its associated IP address.

Note: Ensure that you do not block important IP addresses, such as your DNS or DHCP server, or other ISP-related servers.

- 1 On the McAfee SecurityCenter pane, click **Internet & Network**, then click **Configure**.
- 2 On the Internet & Network Configuration pane, under **Firewall protection is enabled**, click **Advanced**.
- 3 On the Firewall pane, click **Banned IPs**.
- 4 On the Banned IPs pane, click **Add**.
- 5 If the computer connection is on an IPv6 network, select the **IPv6** check box.
- 6 Under **Add Rule**, do one of the following:
 - Select **Single**, and then enter the IP address in the **IP Address** box.
 - Select **Range**, and then enter the starting and ending IP addresses in the **From IP Address** and **To IP Address** boxes. If your computer connection is on an IPv6 network, enter the starting IP address and the prefix length in the **From IP Address** and **Prefix Length** boxes.
- 7 Optionally, select **Rule expires in**, and enter the number of days to enforce the rule.
- 8 Optionally, type a description for the rule.
- 9 Click **OK**.
- 10 Click **Yes** to confirm.

Edit a banned computer connection

You can edit a banned computer connection and its associated IP address.

- 1 On the McAfee SecurityCenter pane, click **Internet & Network**, then click **Configure**.
- 2 On the Internet & Network Configuration pane, under **Firewall protection is enabled**, click **Advanced**.
- 3 On the Firewall pane, click **Banned IPs**.
- 4 On the Banned IPs pane, click **Edit**.
- 5 If the computer connection is on an IPv6 network, select the **IPv6** check box.
- 6 Under **Edit Rule**, do one of the following:
 - Select **Single**, and then enter the IP address in the **IP Address** box.
 - Select **Range**, and then enter the starting and ending IP addresses in the **From IP Address** and **To IP Address** boxes. If your computer connection is on an IPv6 network, enter the starting IP address and the prefix length in the **From IP Address** and **Prefix Length** boxes.
- 7 Optionally, select **Rule expires in**, and enter the number of days to enforce the rule.
- 8 Optionally, type a description for the rule.
- 9 Click **OK**.

Remove a banned computer connection

You can remove a banned computer connection and its associated IP address.

- 1 On the McAfee SecurityCenter pane, click **Internet & Network**, then click **Configure**.
- 2 On the Internet & Network Configuration pane, under **Firewall protection is enabled**, click **Advanced**.
- 3 On the Firewall pane, click **Banned IPs**.
- 4 On the Banned IPs pane, select an IP address, and then click **Remove**.
- 5 Click **Yes** to confirm.

Ban a computer from the Inbound Events log

You can ban a computer connection and its associated IP address from the Inbound Events log. Use this log, which lists the IP addresses of all inbound Internet traffic, to ban an IP address that you suspect is the source of suspicious or undesirable Internet activity.

Add an IP address to your **Banned IPs** list if you want to block all inbound Internet traffic from that IP address, regardless of whether your System Services ports are opened or closed.

- 1 On the McAfee SecurityCenter pane, under **Common Tasks**, click **Advanced Menu**.
- 2 Click **Reports & Logs**.
- 3 Under **Recent Events**, click **View Log**.
- 4 Click **Internet & Network**, and then click **Inbound Events**.
- 5 Select a source IP address, and under **I want to**, click **Ban this IP**.
- 6 Click **Yes** to confirm.

Ban a computer from the Intrusion Detection Events log

You can ban a computer connection and its associated IP address from the Intrusion Detection Events log.

- 1 On the McAfee SecurityCenter pane, under **Common Tasks**, click **Advanced Menu**.
- 2 Click **Reports & Logs**.
- 3 Under **Recent Events**, click **View Log**.
- 4 Click **Internet & Network**, and then click **Intrusion Detection Events**.
- 5 Select a source IP address, and under **I want to**, click **Ban this IP**.
- 6 Click **Yes** to confirm.

CHAPTER 19

Managing system services

To work properly, certain programs (including web servers and file-sharing server programs) must accept unsolicited connections from other computers through designated system service ports. Typically, Firewall closes these system service ports because they represent the most likely source of insecurities in your system. To accept connections from remote computers, however, the system service ports must be open.

In this chapter

Configuring system service ports98

Configuring system service ports

System service ports can be configured to allow or block remote network access to a service on your computer. These system service ports can be opened or closed for computers listed as Trusted, Standard, or Public in your **Networks** list.

The list below shows the common system services and their associated ports:

- Common Operating System Port 5357
- File Transfer Protocol (FTP) Ports 20-21
- Mail Server (IMAP) Port 143
- Mail Server (POP3) Port 110
- Mail Server (SMTP) Port 25
- Microsoft Directory Server (MSFT DS) Port 445
- Microsoft SQL Server (MSFT SQL) Port 1433
- Network Time Protocol Port 123
- Remote Desktop / Remote Assistance / Terminal Server (RDP) Port 3389
- Remote Procedure Calls (RPC) Port 135
- Secure Web Server (HTTPS) Port 443
- Universal Plug and Play (UPNP) Port 5000
- Web Server (HTTP) Port 80
- Windows File Sharing (NETBIOS) Ports 137-139

System service ports can also be configured to allow a computer to share its Internet connection with other computers connected to it through the same network. This connection, known as Internet Connection Sharing (ICS), allows the computer that is sharing the connection to act as a gateway to the Internet for the other networked computer.

Note: If your computer has an application that accepts either web or FTP server connections, the computer sharing the connection may need to open the associated system service port and allow forwarding of incoming connections for those ports.

Allow access to an existing system service port

You can open an existing port to allow remote network access to a system service on your computer.

Note: An open system service port can make your computer vulnerable to Internet security threats; therefore, only open a port if necessary.

- 1 On the McAfee SecurityCenter pane, click **Internet & Network**, then click **Configure**.
- 2 On the Internet & Network Configuration pane, under **Firewall protection is enabled**, click **Advanced**.
- 3 On the Firewall pane, click **System Services**.
- 4 Under **Open System Service Port**, select a system service to open its port.
- 5 Click **Edit**.
- 6 Do one of the following:
 - To open the port to any computer on a trusted, standard, or public network (for example, a home network, a corporate network, or an Internet network), select **Trusted, Standard, and Public**.
 - To open the port to any computer on a standard network (for example, a corporate network), select **Standard (includes Trusted)**.
- 7 Click **OK**.

Block access to an existing system service port

You can close an existing port to block remote network access to a system service on your computer.

- 1 On the McAfee SecurityCenter pane, click **Internet & Network**, then click **Configure**.
- 2 On the Internet & Network Configuration pane, under **Firewall protection is enabled**, click **Advanced**.
- 3 On the Firewall pane, click **System Services**.
- 4 Under **Open System Service Port**, clear the check box beside the system service port that you want to close.
- 5 Click **OK**.

Configure a new system service port

You can configure a new network service port on your computer that you can open or close to allow or block remote access on your computer.

- 1 On the McAfee SecurityCenter pane, click **Internet & Network**, then click **Configure**.
- 2 On the Internet & Network Configuration pane, under **Firewall protection is enabled**, click **Advanced**.
- 3 On the Firewall pane, click **System Services**.
- 4 Click **Add**.
- 5 In the System Services pane, under **Add System Service Rule**, enter the following:
 - System Service name
 - System Service category
 - Local TCP/IP ports
 - Local UDP ports
- 6 Do one of the following:
 - To open the port to any computer on a trusted, standard, or public network (for example, a home network, a corporate network, or an Internet network), select **Trusted, Standard, and Public**.
 - To open the port to any computer on a standard network (for example, a corporate network), select **Standard (includes Trusted)**.
- 7 If you want to send this port's activity information to another Windows network computer that shares your Internet connection, select **Forward this port's network activity to network computers that use Internet Connection Sharing**.
- 8 Optionally, describe the new configuration.
- 9 Click **OK**.

Note: If your computer has a program that accepts either web or FTP server connections, the computer sharing the connection may need to open the associated system service port and allow forwarding of incoming connections for those ports. If you are using Internet Connection Sharing (ICS), you also need to add a trusted computer connection on the **Networks** list. For more information, see [Add a computer connection](#).

Modify a system service port

You can modify inbound and outbound network access information about an existing system service port.

Note: If port information is entered incorrectly, the system service fails.

- 1 On the McAfee SecurityCenter pane, click **Internet & Network**, then click **Configure**.
- 2 On the Internet & Network Configuration pane, under **Firewall protection is enabled**, click **Advanced**.
- 3 On the Firewall pane, click **System Services**.
- 4 Click the check box beside a system service, and then click **Edit**.
- 5 In the System Services pane, under **Add System Service Rule**, modify the following:
 - System service name
 - Local TCP/IP ports
 - Local UDP ports
- 6 Do one of the following:
 - To open the port to any computer on a trusted, standard, or public network (for example, a home network, a corporate network, or an Internet network), select **Trusted, Standard, and Public**.
 - To open the port to any computer on a standard network (for example, a corporate network), select **Standard (includes Trusted)**.
- 7 If you want to send this port's activity information to another Windows network computer that shares your Internet connection, select **Forward this port's network activity to network computers that use Internet Connection Sharing**.
- 8 Optionally, describe the modified configuration.
- 9 Click **OK**.

Remove a system service port

You can remove an existing system service port from your computer. After removal, remote computers can no longer access the network service on your computer.

- 1 On the McAfee SecurityCenter pane, click **Internet & Network**, then click **Configure**.
- 2 On the Internet & Network Configuration pane, under **Firewall protection is enabled**, click **Advanced**.
- 3 On the Firewall pane, click **System Services**.
- 4 Select a system service, and then click **Remove**.
- 5 At the prompt, click **Yes** to confirm.

CHAPTER 20

Logging, monitoring, and analysis

Firewall provides extensive and easy-to-read logging, monitoring, and analysis for Internet events and traffic. Understanding Internet traffic and events helps you manage your Internet connections.

In this chapter

| | |
|-----------------------------------|-----|
| Event Logging | 104 |
| Working with Statistics | 106 |
| Tracing Internet traffic..... | 107 |
| Monitoring Internet traffic | 110 |

Event Logging

Firewall allows you to enable or disable event logging and, when enabled, which event types to log. Event logging allows you to view recent inbound, outbound events and intrusion events.

Configure event log settings

You can specify and configure the types of Firewall events to log. By default, event logging is enabled for all events and activities.

- 1 On the Internet & Network Configuration pane, under **Firewall protection is enabled**, click **Advanced**.
- 2 On the Firewall pane, click **Event Log Settings**.
- 3 If it is not already selected, select **Enable Event Logging**.
- 4 Under **Enable Event Logging**, select or clear the event types that you want or do not want to log. Event types include the following:
 - Blocked Programs
 - ICMP Pings
 - Traffic from Banned IP Addresses
 - Events on System Service Ports
 - Events on Unknown Ports
 - Intrusion Detection (IDS) events
- 5 To prevent logging on specific ports, select **Do not log events on the following port(s)**, and then enter single port numbers separated by commas, or port ranges with dashes. For example, 137-139, 445, 400-5000.
- 6 Click **OK**.

View recent events

If logging is enabled, you can view recent events. The Recent Events pane shows the date and description of the event. It displays activity for programs that have been explicitly blocked from accessing the Internet.

- On the **Advanced Menu**, under the Common Tasks pane, click **Reports & Logs** or **View Recent Events**. Alternatively, click **View Recent Events** under the Common Tasks pane from the Basic Menu.

View inbound events

If logging is enabled, you can view inbound events. Inbound Events include the date and time, source IP address, host name, and information and event type.

- 1 Ensure the Advanced menu is enabled. On the Common Tasks pane, click **Reports & Logs**.
- 2 Under **Recent Events**, click **View Log**.
- 3 Click **Internet & Network**, and then click **Inbound Events**.

Note: You can trust, ban, and trace an IP address from the Inbound Event log.

View outbound events

If logging is enabled, you can view outbound events. Outbound Events include the name of the program attempting outbound access, the date and time of the event, and the location of the program on your computer.

- 1 On the Common Tasks pane, click **Reports & Logs**.
- 2 Under **Recent Events**, click **View Log**.
- 3 Click **Internet & Network**, and then click **Outbound Events**.

Note: You can allow full and outbound-only access for a program from the Outbound Events log. You can also locate additional information about the program.

View intrusion detection events

If logging is enabled, you can view inbound intrusion events. Intrusion Detection events display the date and time, the source IP, the host name of the event, and the type of event.

- 1 On the Common Tasks pane, click **Reports & Logs**.
- 2 Under **Recent Events**, click **View Log**.
- 3 Click **Internet & Network**, and then click **Intrusion Detection Events**.

Note: You can ban and trace an IP address from the Intrusion Detection Events log.

Working with Statistics

Firewall leverages McAfee's HackerWatch security Web site to provide you with statistics about global Internet security events and port activity.

View global security event statistics

HackerWatch tracks worldwide Internet security events, which you can view from SecurityCenter. Information tracked lists incidents reported to HackerWatch in the last 24 hours, 7 days, and 30 days.

- 1 Ensure that the Advanced Menu is enabled, and then click **Tools**.
- 2 On the Tools pane, click **HackerWatch**.
- 3 Under Event Tracking, view security event statistics.

View global Internet port activity

HackerWatch tracks worldwide Internet security events, which you can view from SecurityCenter. Information displayed includes the top event ports reported to HackerWatch during the past seven days. Typically, HTTP, TCP, and UDP port information is displayed.

- 1 Ensure that the Advanced Menu is enabled, and then click **Tools**.
- 2 On the Tools pane, click **HackerWatch**.
- 3 View the top event port events under **Recent Port Activity**.

Tracing Internet traffic

Firewall offers a number of options for tracing Internet traffic. These options let you geographically trace a network computer, obtain domain and network information, and trace computers from the Inbound Events and Intrusion Detection Events logs.

Geographically trace a network computer

You can use Visual Tracer to geographically locate a computer that is connecting or attempting to connect to your computer, using its name or IP address. You can also access network and registration information using Visual Tracer. Running Visual Tracer displays a world map which displays the most probable route of data taken from the source computer to yours.

- 1 Ensure that the Advanced Menu is enabled, and then click **Tools**.
- 2 On the Tools pane, click **Visual Tracer**.
- 3 Type the computer's IP address, and click **Trace**.
- 4 Under **Visual Tracer**, select **Map View**.

Note: You cannot trace looped, private, or invalid IP address events.

Obtain computer registration information

You can obtain a computer's registration information from SecurityCenter using Visual Trace. Information includes the domain name, the registrant's name and address, and the administrative contact.

- 1 Ensure that the Advanced Menu is enabled, and then click **Tools**.
- 2 On the Tools pane, click **Visual Tracer**.
- 3 Type the computer's IP address, and then click **Trace**.
- 4 Under **Visual Tracer**, select **Registrant View**.

Obtain computer network information

You can obtain a computer's network information from SecurityCenter using Visual Trace. Network information includes details about the network on which the domain resides.

- 1 Ensure that the Advanced Menu is enabled, and then click **Tools**.
- 2 On the Tools pane, click **Visual Tracer**.
- 3 Type the computer's IP address, and then click **Trace**.
- 4 Under **Visual Tracer**, select **Network View**.

Trace a computer from the Inbound Events log

From the Inbound Events pane, you can trace an IP address that appears in the Inbound Events log.

- 1 Ensure the Advanced menu is enabled. On the Common Tasks pane, click **Reports & Logs**.
- 2 Under **Recent Events**, click **View Log**.
- 3 Click **Internet & Network**, and then click **Inbound Events**.
- 4 On the Inbound Events pane, select a source IP address, and then click **Trace this IP**.
- 5 On the Visual Tracer pane, click one of the following:
 - **Map View**: Geographically locate a computer using the selected IP address.
 - **Registrant View**: Locate domain information using the selected IP address.
 - **Network View**: Locate network information using the selected IP address.
- 6 Click **Done**.

Trace a computer from the Intrusion Detection Events log

From the Intrusion Detection Events pane, you can trace an IP address that appears in the Intrusion Detection Events log.

- 1 On the Common Tasks pane, click **Reports & Logs**.
- 2 Under **Recent Events**, click **View Log**.
- 3 Click **Internet & Network**, and then click **Intrusion Detection Events**. On the Intrusion Detection Events pane, select a source IP address, and then click **Trace this IP**.
- 4 On the Visual Tracer pane, click one of the following:
 - **Map View**: Geographically locate a computer using the selected IP address.
 - **Registrant View**: Locate domain information using the selected IP address.
 - **Network View**: Locate network information using the selected IP address.
- 5 Click **Done**.

Trace a monitored IP address

You can trace a monitored IP address to obtain a geographical view which shows the most probable route of data taken from the source computer to yours. In addition, you can obtain registration and network information about the IP address.

- 1 Ensure that the Advanced Menu is enabled and click **Tools**.
- 2 On the Tools pane, click **Traffic Monitor**.
- 3 Under **Traffic Monitor**, click **Active Programs**.
- 4 Select a program and then the IP address that appears below the program name.
- 5 Under **Program Activity**, click **Trace this IP**.
- 6 Under **Visual Tracer**, you can view a map which shows the most probable route of data taken from the source computer to yours. In addition, you can obtain registration and network information about the IP address.

Note: To view the most up-to-date statistics, click **Refresh** under **Visual Tracer**.

Monitoring Internet traffic

Firewall provides a number of methods to monitor your Internet traffic, including the following:

- **Traffic Analysis graph:** Displays recent inbound and outbound Internet traffic.
- **Traffic Usage graph:** Displays the percentage of bandwidth used by the most active programs during the past 24 hour period.
- **Active Programs:** Displays those programs that currently use the most network connections on your computer and the IP addresses the programs access.

About the Traffic Analysis graph

The Traffic Analysis graph is a numerical and graphical representation of inbound and outbound Internet traffic. Also, the Traffic Monitor displays programs that use the most network connections on your computer and the IP addresses that the programs access.

From the Traffic Analysis pane, you can view recent inbound and outbound Internet traffic, current, average, and maximum transfer rates. You can also view traffic volume, including the amount of traffic since you started Firewall, and the total traffic for the current and previous months.

The Traffic Analysis pane displays real-time Internet activity on your computer, including the volume and rate of recent inbound and outbound Internet traffic on your computer, connection speed, and total bytes transferred across the Internet.

The solid green line represents the current rate of transfer for incoming traffic. The dotted green line represents the average rate of transfer for incoming traffic. If the current rate of transfer and the average rate of transfer are the same, the dotted line does not appear on the graph. The solid line represents both the average and current rates of transfer.

The solid red line represents the current rate of transfer for outgoing traffic. The red dotted line represents the average rate of transfer for outgoing traffic. If the current rate of transfer and the average rate of transfer are the same, the dotted line does not appear on the graph. The solid line represents both the average and current rates of transfer.

Analyze inbound and outbound traffic

The Traffic Analysis graph is a numerical and graphical representation of inbound and outbound Internet traffic. Also, the Traffic Monitor displays programs that use the most network connections on your computer and the IP addresses that the programs access.

- 1 Ensure that the Advanced Menu is enabled, and then click **Tools**.
- 2 On the Tools pane, click **Traffic Monitor**.
- 3 Under **Traffic Monitor**, click **Traffic Analysis**.

Tip: To view the most up-to-date statistics, click **Refresh** under **Traffic Analysis**.

Monitor program bandwidth

You can view the pie chart, which displays the approximate percentage of bandwidth used by the most active programs on your computer during the past twenty-four hour period. The pie chart provides visual representation of the relative amounts of bandwidth used by the programs.

- 1 Ensure that the Advanced Menu is enabled, and then click **Tools**.
- 2 On the Tools pane, click **Traffic Monitor**.
- 3 Under **Traffic Monitor**, click **Traffic Usage**.

Tip: To view the most up-to-date statistics, click **Refresh** under **Traffic Usage**.

Monitor program activity

You can view inbound and outbound program activity, which displays remote computer connections and ports.

- 1 Ensure that the Advanced Menu is enabled, and then click **Tools**.
- 2 On the Tools pane, click **Traffic Monitor**.
- 3 Under **Traffic Monitor**, click **Active Programs**.
- 4 You can view the following information:
 - Program Activity graph: Select a program to display a graph of its activity.
 - Listening connection: Select a Listening item under the program name.
 - Computer connection: Select an IP address under the program name, system process, or service.

Note: To view the most up-to-date statistics, click **Refresh** under **Active Programs**.

CHAPTER 21

Learning about Internet security

Firewall leverages McAfee's security Web site, HackerWatch, to provide up-to-date information about programs and global Internet activity. HackerWatch also provides an HTML tutorial about Firewall.

In this chapter

Launch the HackerWatch tutorial..... 114

Launch the HackerWatch tutorial

To learn about Firewall, you can access the HackerWatch tutorial from SecurityCenter.

- 1 Ensure that the Advanced Menu is enabled, and then click **Tools**.
- 2 On the Tools pane, click **HackerWatch**.
- 3 Under **HackerWatch Resources**, click **View Tutorial**.

CHAPTER 22

McAfee Anti-Spam

Anti-Spam (formerly called SpamKiller) stops unsolicited e-mail from entering your Inbox by examining your incoming e-mail, and then marking it as spam (e-mail soliciting you to purchase something) or phishing (e-mail soliciting you to provide personal information to a potentially fraudulent Web site). Anti-Spam then filters the spam e-mail and moves it to the McAfee Anti-Spam folder.

If your friends sometimes send you legitimate e-mail that may appear as spam, you can ensure that it is not filtered by adding their e-mail addresses to Anti-Spam's friends list. You can also customize how spam is detected. For example, you can filter messages more aggressively, specify what to look for in a message, and create your own filters.

Anti-Spam also protects you if you try to access a potentially fraudulent Web site through a link in an e-mail message. When you click a link to a potentially fraudulent Web site, you are redirected to the Phishing filter safe page. If there are Web sites that you do not want filtered, you can add them to the whitelist (Web sites in this list are not filtered).

Anti-Spam works with various e-mail programs, such as Yahoo®, MSN®/Hotmail®, Windows® Mail and Live™ Mail, Microsoft® Outlook® and Outlook Express, and Mozilla Thunderbird™, as well as with various e-mail accounts, such as POP3, POP3 Webmail, and MAPI (Microsoft Exchange Server). If you use a browser to read your e-mail, you must add your Webmail account to Anti-Spam. All other accounts are configured automatically and you do not have to add them to Anti-Spam.

You do not have to configure Anti-Spam after you have installed it; however, if you are an advanced user, you may want to fine-tune its advanced spam and phish protection features according to your preferences.

Note: SecurityCenter reports critical and non-critical protection problems as soon as it detects them. If you need help diagnosing your protection problems, you can run McAfee Virtual Technician.

In this chapter

| Setting up your Webmail accounts..... | 133 |
| Working with filtered e-mail | 137 |
| Configuring phishing protection | 139 |

Anti-Spam features

Spam filtering

Prevent unsolicited email from entering your Inbox. Anti-Spam's advanced filters are updated automatically for all your email accounts. You can also create custom filters to ensure that all spam is filtered, and report spam to McAfee for analysis.

Phishing filtering

Identify potential phishing (fraudulent) websites that solicit personal information.

Customized spam processing

Mark unsolicited email as spam and move it to your McAfee Anti-Spam folder, or mark legitimate email as not spam and move it to your Inbox.

Friends

Import your friends' email addresses to the Friends list so that their email messages are not filtered.

CHAPTER 23

Configuring spam detection

Anti-Spam allows you to customize how spam is detected. You can filter messages more aggressively, specify what to look for in a message, and look for specific character sets when analyzing spam. You can also create personal filters to fine-tune which messages Anti-Spam identifies as spam. For example, if unsolicited e-mail that contains the word mortgage is not filtered, you can add a filter that contains the word mortgage.

If you are having issues with your e-mail, you can disable spam protection as part of your troubleshooting strategy.

In this chapter

| | |
|---------------------------------|-----|
| Setting filtering options | 120 |
| Using personal filters | 123 |
| Disable spam protection | 125 |

Setting filtering options

Adjust Anti-Spam's filtering options if you want to filter messages more aggressively, specify how you want to process spam, and look for specific character sets when analyzing spam.

Filtering level

The filtering level dictates how aggressively your e-mail is filtered. For example, if spam is not filtered and your filtering level is set to Medium, you can change it to Medium-High or High. However, if the filtering level is set to High, only e-mail messages from senders in your friends list are accepted: all others are filtered.

Spam processing

Anti-Spam allows you to customize various spam processing options. For example, you can put spam and phishing e-mail in specific folders, change the name of the tag that appears in the subject line of the spam and phishing e-mail, specify a maximum size to filter, and specify how often to update your spam rules.

Character sets

Anti-Spam can look for specific character sets when analyzing spam. Character sets are used to represent a language, including the language's alphabet, numeric digits, and other symbols. If you are receiving spam in Greek, you can filter all messages that contain the Greek character set.

Be careful not to filter character sets for languages in which you receive legitimate e-mail. For example, if you only want to filter messages in Italian, you might select Western European because Italy is in Western Europe. However, if you receive legitimate e-mail in English, selecting Western European will also filter messages in English and any other languages in the Western European character set. In this case, you cannot filter messages in Italian only.

Note: Specifying a character set filter is for advanced users.

Change the filtering level

You can change how aggressively you want to filter your e-mail. For example, if legitimate messages are filtered, you can lower the filtering level.

1 Open the Spam Protection pane.

How?

1. On the SecurityCenter Home pane, click **E-mail & IM**.
 2. In the E-mail & IM information area, click **Configure**.
 3. On the E-mail & IM Configuration pane, under **Spam protection is enabled**, click **Advanced**.
- 2 On the Spam Protection pane, click **Filtering Options**.
 - 3 In the **Specify a spam filter level** list, select the appropriate level, and then click **OK**.

| Level | Description |
|----------------------|---|
| Low | Most e-mail is accepted. |
| Medium-Low | Only obvious spam messages are filtered. |
| Medium (Recommended) | E-mail is filtered at the recommended level. |
| Medium-High | Any e-mail that resembles spam is filtered. |
| High | Only messages from senders in your friends list are accepted. |

Modify how spam is processed and marked

You can specify a folder in which to put spam and phishing e-mail, change the [SPAM] or [PHISH] tag that appears in the e-mail subject line, specify a maximum size to filter, and specify how often to update your spam rules.

- 1 Open the Spam Protection pane.

How?

 1. On the SecurityCenter Home pane, click **E-mail & IM**.
 2. In the E-mail & IM information area, click **Configure**.
 3. On the E-mail & IM Configuration pane, under **Spam protection is enabled**, click **Advanced**.
- 2 On the Spam Protection pane, click **Filtering Options**.
- 3 Modify or select the appropriate options below, and then click **OK**.

| To... | Do this... |
|---|---|
| Specify the location where to put spam and phish e-mail | In the Put spam email in this folder list, select a folder. The default folder is McAfee Anti-Spam. |
| Change the subject line of the spam e-mail | In Mark the subject of the spam email with , specify a tag to add to the subject line of spam e-mail. The default tag is [SPAM]. |

| To... | Do this... |
|---|--|
| Change the subject line of phish e-mail | In Mark the subject of the phish email with , specify a tag to add to the subject line of phish e-mail. The default tag is [PHISH]. |
| Specify the largest e-mail to filter | In Specify largest email to filter (size in KB) , enter the largest size of e-mail that you want to filter. |
| Update the spam rules | Select Update spam rules (in minutes) , then enter the frequency in which to update your spam rules. The recommended frequency is 30 minutes. If you have a fast network connection, you may specify a higher frequency, such as 5 minutes, for better results. |
| Not update the spam rules | Select Don't update spam rules . |

Apply character set filters

Note: Filtering messages that contain characters from a specific character set is for advanced users.

You can filter specific language character sets; however, do not filter character sets for languages in which you receive legitimate e-mail.

- 1 Open the Spam Protection pane.
 - How?
 1. On the SecurityCenter Home pane, click **E-mail & IM**.
 2. In the E-mail & IM information area, click **Configure**.
 3. On the E-mail & IM Configuration pane, under **Spam protection is enabled**, click **Advanced**.
- 2 On the Spam Protection pane, click **Character Sets**.
- 3 Select the check boxes beside the character sets you want to filter.
- 4 Click **OK**.

Using personal filters

A personal filter specifies whether to allow or block e-mail messages based on specific words or phrases. If an e-mail message contains a word or phrase that the filter is set to block, the message is marked as spam and left in your Inbox or moved to the McAfee Anti-Spam folder. For more information about how spam is handled, see *Modify how a message is processed and marked* (page 121).

Anti-Spam features an advanced filter to prevent unsolicited e-mail messages from entering your Inbox; however, if you want to fine-tune which messages Anti-Spam identifies as spam, you can create a personal filter. For example, if you add a filter that contains the word mortgage, Anti-Spam filters messages with the word mortgage. Do not create filters for common words that appear in legitimate e-mail messages, because then even non-spam e-mail will be filtered. After you create a filter, you can edit it if you find that the filter is still not detecting some spam. For example, if you created a filter to look for the word viagra in the subject of the message, but you are still receiving messages that contain the word viagra because it's appearing in the body of the message, change the filter to look for viagra in the message body instead of the message subject.

Regular expressions (RegEx) are special characters and sequences that can also be used in personal filters; however, McAfee only recommends using regular expressions if you are an advanced user. If you are not familiar with regular expressions, or you want more information about how to use them, you can research regular expressions on the Web (for example, go to http://en.wikipedia.org/wiki/Regular_expression).

Add a personal filter

You can add filters to fine-tune which messages Anti-Spam identifies as spam.

- 1 Open the Spam Protection pane.
How?
 1. On the SecurityCenter Home pane, click **E-mail & IM**.
 2. In the E-mail & IM information area, click **Configure**.
 3. On the E-mail & IM Configuration pane, under **Spam protection is enabled**, click **Advanced**.
- 2 On the Spam Protection pane, click **Personal Filters**.
- 3 Click **Add**.
- 4 Specify what the personal filter looks for (page 124) in an e-mail message.
- 5 Click **OK**.

Edit a personal filter

Edit existing filters to fine-tune which messages are identified as spam.

- 1 Open the Spam Protection pane.

How?

 1. On the SecurityCenter Home pane, click **E-mail & IM**.
 2. In the E-mail & IM information area, click **Configure**.
 3. On the E-mail & IM Configuration pane, under **Spam protection is enabled**, click **Advanced**.
- 2 On the Spam Protection pane, click **Personal Filters**.
- 3 Select the filter you want to edit, and then click **Edit**.
- 4 Specify what the personal filter looks for (page 124) in an e-mail message.
- 5 Click **OK**.

Remove a personal filter

You can permanently remove filters that you no longer want to use.

- 1 Open the Spam Protection pane.

How?

 1. On the SecurityCenter Home pane, click **E-mail & IM**.
 2. In the E-mail & IM information area, click **Configure**.
 3. On the E-mail & IM Configuration pane, under **Spam protection is enabled**, click **Advanced**.
- 2 On the Spam Protection pane, click **Personal Filters**.
- 3 Select the filter you want to remove, and then click **Remove**.
- 4 Click **OK**.

Specify a personal filter

This table describes what a personal filter looks for in an e-mail.

| To... | Do this... |
|-----------------------------------|---|
| Specify the e-mail part to filter | <p>In the Email part list, click an entry to determine whether the filter looks for the words or phrases in the e-mail subject, body, sender, header, or the recipient.</p> <p>Under the Email part list, click an entry to determine whether the filter looks for e-mail that contains, or does not contain, the words or phrases you specify.</p> |

| To... | Do this... |
|--|---|
| Specify the words or phrases in your filter | In Words or phrases , type what to look for in an e-mail. For example, if you specify <i>mortgage</i> , all e-mail that contains this word are filtered. |
| Specify that the filter uses regular expressions | Select This filter uses regular expressions . |
| Select whether to block or allow e-mail according to the words or phrases in your filter | In Perform this action , select either Block or Allow to block or allow e-mail that contains the words or phrases in your filter. |

Disable spam protection

You can disable spam protection to prevent Anti-Spam from filtering e-mail.

- 1 On the Advanced Menu, click **Configure**.
- 2 On the Configure pane, click **E-mail & IM**.
- 3 Under **Spam protection is enabled**, click **Off**.

Tip: Remember to click **On** under **Spam protection is disabled** so that you are protected against spam.

CHAPTER 24

Filtering e-mail

Anti-Spam examines your incoming e-mail, and categorizes it as spam (e-mail soliciting you to purchase something) or phishing (e-mail soliciting you to provide personal information to a potentially fraudulent Web site). By default, Anti-Spam then marks each unsolicited e-mail message as spam or phishing (the tag [SPAM] or [PHISH] appears in the subject line of the message), and moves the message to the McAfee Anti-Spam folder.

You can mark e-mail as spam or not spam from the Anti-Spam toolbar, change the location where spam messages are moved, or change the tag that appears in the subject line.

You can also disable Anti-Spam toolbars as part of your troubleshooting strategy when you are experiencing issues with your e-mail program.

In this chapter

Mark a message from the Anti-Spam toolbar 127
 Disable the Anti-Spam toolbar..... 128

Mark a message from the Anti-Spam toolbar

When you mark a message as spam, the subject of the message is tagged with [SPAM] or a tag of your choice and left in your Inbox, your McAfee Anti-Spam folder (Outlook, Outlook Express, Windows Mail, Thunderbird), or your Junk folder (Eudora®). When you mark a message as not spam, the message tag is removed and the message is moved to your Inbox.

| To mark a message in... | Select a message, and then... |
|--|--|
| Outlook, Outlook Express, Windows Mail | Click Mark as Spam or Mark as Not Spam . |
| Eudora | On the Anti-Spam menu, click Mark as Spam or Mark as Not Spam . |
| Thunderbird | On the Anti-Spam toolbar, point to M , point to Mark As , and then click Spam or Not Spam . |

Disable the Anti-Spam toolbar

If you are using Outlook, Outlook Express, Windows Mail, Eudora, or Thunderbird, you can disable the Anti-Spam toolbar.

- 1 Open the Spam Protection pane.

How?

1. On the SecurityCenter Home pane, click **E-mail & IM**.
 2. In the E-mail & IM information area, click **Configure**.
 3. On the E-mail & IM Configuration pane, under **Spam protection is enabled**, click **Advanced**.
- 2 On the Spam Protection pane, click **Email Toolbars**.
 - 3 Clear the check box beside the toolbar you want to disable.
 - 4 Click **OK**.

Tip: You can re-enable your Anti-Spam toolbars at any time by selecting their check boxes.

CHAPTER 25

Setting up friends

Because of Anti-Spam's improved filter which recognizes and allows legitimate e-mail messages, it is rare that you need to add your friends' e-mail address to your friends list, whether you add them manually or import your address books. However, if you still add a friend's e-mail address, and someone spoofs it, then Anti-Spam will allow messages from that e-mail address in your Inbox.

If you still want to import your address books, and they change, you have to import them again because Anti-Spam does not automatically update your friends list.

You can also update your Anti-Spam friends list manually, or add an entire domain if you want each user on the domain to be added to your friends list. For example, if you add the company.com domain, none of the e-mail from that organization is filtered.

In this chapter

| | |
|-----------------------------------|-----|
| Import an address book..... | 129 |
| Setting up friends manually | 130 |

Import an address book

Import your address books if you want Anti-Spam to add their e-mail addresses to your friends list.

- 1 Open the Spam Protection pane.
How?
 1. On the SecurityCenter Home pane, click **E-mail & IM**.
 2. In the E-mail & IM information area, click **Configure**.
 3. On the E-mail & IM Configuration pane, under **Spam protection is enabled**, click **Advanced**.
- 2 On the Spam Protection pane, click **Friends**.
- 3 On the Friends pane, click **Import**.
- 4 Click the type of address book you want to import in the **Select an address book to import** list.
- 5 Click **Import Now**.

Setting up friends manually

You manually update your list of friends by editing the entries one-by-one. For example, if you receive an e-mail from a friend whose address is not in your address book, you can manually add their e-mail address right away. The easiest way to do this is to use the Anti-Spam toolbar. If you do not use the Anti-Spam toolbar, you must specify your friend's information.

Add a friend from the Anti-Spam toolbar

If you are using Outlook, Outlook Express, Windows Mail, Eudora™, or Thunderbird e-mail programs, you can add friends directly from the Anti-Spam toolbar.

| To add a friend in... | Select a message, and then... |
|--|---|
| Outlook, Outlook Express, Windows Mail | Click Add Friend . |
| Eudora | On the Anti-Spam menu, click Add Friend . |
| Thunderbird | On the Anti-Spam toolbar, point to M , point to Mark As , and then click Friend . |

Add a friend manually

If you do not want to add a friend directly from the toolbar, or you forgot to do so when you received the e-mail message, you can still add a friend to your friends list.

- 1 Open the Spam Protection pane.
 - How?
 1. On the SecurityCenter Home pane, click **E-mail & IM**.
 2. In the E-mail & IM information area, click **Configure**.
 3. On the E-mail & IM Configuration pane, under **Spam protection is enabled**, click **Advanced**.
- 2 On the Spam Protection pane, click **Friends**.
- 3 On the Friends pane, click **Add**.
- 4 Type the name of your friend in the **Name** box.
- 5 Select **Single email address** in the **Type** list.
- 6 Type the e-mail address of your friend in the **Email Address** box.
- 7 Click **OK**.

Add a domain

Add an entire domain if you want to add every user on that domain to your friends list. For example, if you add the company.com domain, none of the e-mail from that organization is filtered.

- 1 Open the Spam Protection pane.
How?
 1. On the SecurityCenter Home pane, click **E-mail & IM**.
 2. In the E-mail & IM information area, click **Configure**.
 3. On the E-mail & IM Configuration pane, under **Spam protection is enabled**, click **Advanced**.
- 2 On the Spam Protection pane, click **Friends**.
- 3 On the Friends pane, click **Add**.
- 4 Type the name of the organization or group, in the **Name** box.
- 5 Select **Entire domain** in the **Type** list.
- 6 Type the domain name in the **Email Address** box.
- 7 Click **OK**.

Edit a friend

If the information for a friend changes, you can update your friends list to ensure that Anti-Spam does not mark their messages as spam.

- 1 Open the Spam Protection pane.
How?
 1. On the SecurityCenter Home pane, click **E-mail & IM**.
 2. In the E-mail & IM information area, click **Configure**.
 3. On the E-mail & IM Configuration pane, under **Spam protection is enabled**, click **Advanced**.
- 2 On the Spam Protection pane, click **Friends**.
- 3 Select the friend you want to edit, and then click **Edit**.
- 4 Change the name of your friend in the **Name** box.
- 5 Change the e-mail address of your friend in the **Email Address** box.
- 6 Click **OK**.

Edit a domain

If the information for a domain changes, you can update your friends list to ensure that Anti-Spam does not mark the messages from that domain as spam.

- 1 Open the Spam Protection pane.

How?

1. On the SecurityCenter Home pane, click **E-mail & IM**.
 2. In the E-mail & IM information area, click **Configure**.
 3. On the E-mail & IM Configuration pane, under **Spam protection is enabled**, click **Advanced**.
- 2 On the Spam Protection pane, click **Friends**.
 - 3 On the Friends pane, click **Add**.
 - 4 Change the name of the organization or group in the **Name** box.
 - 5 Select **Entire domain** in the **Type** list.
 - 6 Change the domain name in the **Email Address** box.
 - 7 Click **OK**.

Remove a friend

If a person or a domain in your friends list sends you spam, remove them from the Anti-Spam friends list so that their e-mail messages are filtered again.

- 1 Open the Spam Protection pane.

How?

1. On the SecurityCenter Home pane, click **E-mail & IM**.
 2. In the E-mail & IM information area, click **Configure**.
 3. On the E-mail & IM Configuration pane, under **Spam protection is enabled**, click **Advanced**.
- 2 On the Spam Protection pane, click **Friends**.
 - 3 Select the friend you want to remove, and then click **Remove**.

CHAPTER 26

Setting up your Webmail accounts

If you use a browser to read your e-mail messages, you must configure Anti-Spam to connect to your account and filter your messages. To add your Webmail account to Anti-Spam, simply add the account information provided by your e-mail provider.

After you add a Webmail account, you can edit your account information, and obtain more information about filtered Webmail. If you are not using a Webmail account any more, or you do not want it filtered, you can remove it.

Anti-Spam works with various e-mail programs, such as Yahoo!®, MSN®/Hotmail®, Windows® Mail and Live™ Mail, Microsoft® Outlook® and Outlook Express, and Mozilla Thunderbird™, as well as with various e-mail accounts, such as POP3, POP3 Webmail, and MAPI (Microsoft Exchange Server). POP3 is the most common account type, and is the standard for Internet e-mail. When you have a POP3 account, Anti-Spam connects directly to the e-mail server and filters messages before they are retrieved by your Webmail account. POP3 Webmail, Yahoo!, MSN/Hotmail, and Windows Mail accounts are Web-based. Filtering POP3 Webmail accounts is similar to filtering POP3 accounts.

In this chapter

| | |
|---|-----|
| Add a Webmail account..... | 133 |
| Edit a Webmail account..... | 134 |
| Remove a Webmail account..... | 135 |
| Understanding Webmail account information | 135 |

Add a Webmail account

Add a POP3 (for example, Yahoo), MSN/Hotmail, or Windows Mail (only paid versions are fully supported) Webmail account if you want to filter the messages in that account for spam.

- 1 Open the Spam Protection pane.

How?

1. On the SecurityCenter Home pane, click **E-mail & IM**.
2. In the E-mail & IM information area, click **Configure**.
3. On the E-mail & IM Configuration pane, under **Spam protection is enabled**, click **Advanced**.
- 2 On the Spam Protection pane, click **Webmail Accounts**.
- 3 On the Webmail Accounts pane, click **Add**.
- 4 Specify the account information (page 135), and then click **Next**.
- 5 Under **Checking Options**, specify when Anti-Spam checks your account for spam (page 135).
- 6 If you are using a dial-up connection, specify how Anti-Spam connects to the Internet (page 135).
- 7 Click **Finish**.

Edit a Webmail account

You must edit your Webmail account information when changes to your account occur. For example, edit your Webmail account if you change your password, or if you want Anti-Spam to check for spam more frequently.

- 1 Open the Spam Protection pane.
How?
 1. On the SecurityCenter Home pane, click **E-mail & IM**.
 2. In the E-mail & IM information area, click **Configure**.
 3. On the E-mail & IM Configuration pane, under **Spam protection is enabled**, click **Advanced**.
- 2 On the Spam Protection pane, click **Webmail Accounts**.
- 3 Select the account you want to modify, and then click **Edit**.
- 4 Specify the account information (page 135), and then click **Next**.
- 5 Under **Checking Options**, specify when Anti-Spam checks your account for spam (page 135).
- 6 If you are using a dial-up connection, specify how Anti-Spam connects to the Internet (page 135).
- 7 Click **Finish**.

Remove a Webmail account

Remove a Webmail account if you no longer want to filter its e-mail for spam. For example, if your account is not active any more or you are experiencing problems, you can remove the account while you troubleshoot the issue.

- 1 Open the Spam Protection pane.

How?

 1. On the SecurityCenter Home pane, click **E-mail & IM**.
 2. In the E-mail & IM information area, click **Configure**.
 3. On the E-mail & IM Configuration pane, under **Spam protection is enabled**, click **Advanced**.
- 2 On the Spam Protection pane, click **Webmail Accounts**.
- 3 Select the account you want to remove, and then click **Remove**.

Understanding Webmail account information

The following tables describe the information you must specify when adding or editing Webmail accounts.

Account information

| Information | Description |
|------------------|--|
| Description | Describe the account for your own reference. You can type any information in this box. |
| E-mail Address | Specify the e-mail address associated with this e-mail account. |
| Account Type | Specify the type of e-mail account you are adding. (for example, POP3 Webmail or MSN/Hotmail). |
| Server | Specify the name of the mail server that hosts this account. If you do not know your server name, refer to the information provided by your Internet Service Provider (ISP). |
| User Name | Specify the user name for this e-mail account. For example, if your e-mail address is <i>username@hotmail.com</i> , the user name is likely <i>username</i> . |
| Password | Specify the password for this e-mail account. |
| Confirm Password | Verify the password for this e-mail account. |

Checking options

| Option | Description |
|------------------|--|
| Check every | Anti-Spam checks this account for spam at the interval (number of minutes) you specify. The interval must be between 5 and 3600 minutes. |
| Check on startup | Anti-Spam checks this account every time you restart the computer. |

Connection options

| Option | Description |
|--|---|
| Never dial a connection | Anti-Spam does not automatically dial a connection for you. You must manually start your dial-up connection. |
| Dial when no connection is available | When an Internet connection is not available, Anti-Spam attempts to connect using the dial-up connection you specify. |
| Always dial the specified connection | Anti-Spam attempts to connect using the dial-up connection you specify. If you are currently connected through a different dial-up connection than the one you specify, you will be disconnected. |
| Dial this connection | Specify the dial-up connection Anti-Spam uses to connect to the Internet. |
| Stay connected after filtering has completed | Your computer stays connected to the Internet after filtering is complete. |

CHAPTER 27

Working with filtered e-mail

At times, some spam may not be detected. When this happens, you can report spam to McAfee, where it is analyzed to create filter updates.

If you are using a Webmail account, you can view, export, and delete your filtered e-mail messages. This is useful when you are not sure whether a legitimate message was filtered, or if you want to know when the message was filtered.

In this chapter

| | |
|--|-----|
| Report e-mail messages to McAfee | 137 |
| View, export, or delete filtered Webmail | 138 |
| View an event for filtered Webmail..... | 138 |

Report e-mail messages to McAfee

You can report e-mail messages to McAfee when you mark them as spam or not spam, so that we can analyze them to create filter updates.

- 1 Open the Spam Protection pane.
How?
 1. On the SecurityCenter Home pane, click **E-mail & IM**.
 2. In the E-mail & IM information area, click **Configure**.
 3. On the E-mail & IM Configuration pane, under **Spam protection is enabled**, click **Advanced**.
- 2 On the Spam Protection pane, click **Email Toolbars**.
- 3 Under **Help Improve Anti-Spam**, select the appropriate check boxes, and then click **OK**.

| To... | Do this... |
|--|---|
| Report an e-mail to McAfee every time you mark it as spam | Select You mark email as spam . |
| Report an e-mail to McAfee every time you mark it as not spam. | Select You mark email as not spam . |
| Send the entire e-mail, not just the header, to McAfee, when you report an e-mail as not spam. | Select Send entire email (not only header) . |

Note: When you report an e-mail as not spam, and send the entire e-mail to McAfee, the e-mail message is not encrypted.

View, export, or delete filtered Webmail

You can view, export, or delete messages that have been filtered in your Webmail account.

- 1 Under **Common Tasks**, click **Reports & Logs**.
- 2 On the Reports & Logs pane, click **Filtered Webmail**.
- 3 Select a message.
- 4 Under **I want to**, do one of the following:
 - Click **View** to view the message in your default e-mail program.
 - Click **Export** to copy the message to your computer.
 - Click **Delete** to delete the message.

View an event for filtered Webmail

You can view the date and time when e-mail messages were filtered and the account that received them.

- 1 Under **Common Tasks**, click **View Recent Events**.
- 2 On the Recent Events pane, click **View Log**.
- 3 On the left pane, expand the **E-mail & IM** list, and then click **Webmail Filtering Events**.
- 4 Select the log you want to view.

CHAPTER 28

Configuring phishing protection

Anti-Spam categorizes unsolicited e-mail as spam (e-mail soliciting you to purchase), or phishing (e-mail soliciting you to provide personal information to a known or potentially fraudulent Web site). Phishing protection protects you from accessing Web sites that are fraudulent. If you click a link in an e-mail message to a known or potentially fraudulent Web site, Anti-Spam redirects you to the Phishing filter safe page.

If there are Web sites that you do not want to filter, add them to the Phishing whitelist. You can also edit or remove Web sites from the whitelist. You do not need to add sites such as Google®, Yahoo, or McAfee, because these Web sites are not considered fraudulent.

Note: If you have SiteAdvisor installed, you do not receive Anti-Spam phishing protection because SiteAdvisor already has phishing protection similar to Anti-Spam's.

In this chapter

| | |
|--|-----|
| Add a Web site to the whitelist | 139 |
| Edit sites in your whitelist..... | 140 |
| Remove a Web site from the whitelist | 140 |
| Disable phishing protection | 140 |

Add a Web site to the whitelist

If there are Web sites that you do not want to filter, add them to the whitelist.

- 1 Open the Phishing Protection pane.
 1. On the SecurityCenter Home pane, click **Internet & Network**.
 2. In the Internet & Network information area, click **Configure**.
- 2 On the Phishing Protection pane, click **Advanced**.
- 3 Under **Whitelist**, click **Add**.
- 4 Type the Web site address, and then click **OK**.

Edit sites in your whitelist

If you added a Web site to the whitelist and the Web site address changes, you can always update it.

- 1 Open the Phishing Protection pane.
 1. On the SecurityCenter Home pane, click **Internet & Network**.
 2. In the Internet & Network information area, click **Configure**.
- 2 On the Phishing Protection pane, click **Advanced**.
- 3 Under **Whitelist**, select the Web site you want to update, and then click **Edit**.
- 4 Edit the Web site address, and then click **OK**.

Remove a Web site from the whitelist

If you added a Web site to the whitelist because you wanted to access it, but now you want to filter it, remove it from the whitelist.

- 1 Open the Phishing Protection pane.
 1. On the SecurityCenter Home pane, click **Internet & Network**.
 2. In the Internet & Network information area, click **Configure**.
- 2 On the Phishing Protection pane, click **Advanced**.
- 3 Under **Whitelist**, select the Web site you want to remove, and then click **Remove**.

Disable phishing protection

If you already have phishing software that is not from McAfee and there is a conflict, you can disable Anti-Spam phishing protection.

- 1 On the SecurityCenter Home pane, click **Internet & Network**.
- 2 In the Internet & Network information area, click **Configure**.
- 3 Under **Phishing protection is enabled**, click **Off**.

Tip: When you are done, remember to click **On** under **Phishing protection is disabled** so that you are protected against fraudulent Web sites.

CHAPTER 29

McAfee Parental Controls

Parental Controls offers advanced protection for you, your family, your personal files, and your computer. It helps you to guard against online identity theft, block the transmission of personal information, and filter potentially offensive online content (including images). It also allows you to monitor, control, and record unauthorized Web browsing habits, and provides a secure storage area for personal passwords.

Before you begin using Parental Controls, you can familiarize yourself with some of the most popular features. Details about configuring and using these features are provided throughout the Parental Controls help.

Note: SecurityCenter reports critical and non-critical protection problems as soon as it detects them. If you need help diagnosing your protection problems, you can run McAfee Virtual Technician.

In this chapter

| | |
|---|-----|
| Parental Controls features | 142 |
| Protecting your children | 143 |
| Protecting information on the Web | 161 |
| Protecting passwords | 163 |

Parental Controls features

Parental Controls

Filter potentially inappropriate images, enable age-appropriate searching, configure a user's age (which determines what content will be blocked), and set Web browsing time limits (the days and times that a user can access the Web) for SecurityCenter users. Parental Controls also lets you universally restrict access to specific Web sites, and grant or block access based on associated keywords.

Personal Information Protection

Block the transmission of sensitive or confidential information (for example, credit card numbers, bank account numbers, addresses, and so on) across the Web.

Password Vault

Store your personal passwords securely, with confidence so that no other user (not even an administrator) can access them.

CHAPTER 30

Protecting your children

If your children use your computer, you can use Parental Controls to help regulate what each child can see and do when browsing the Web. For example, you can enable or disable age-appropriate searching and image filtering, choose a content rating group, and set Web browsing time limits.

Age-appropriate searching makes sure that the safety filters of some popular search engines are enabled so that potentially inappropriate items are automatically excluded from your child's search results; image filtering blocks potentially inappropriate images from displaying when a child browses the Web; the content rating group determines the kind of Web content that is accessible to a child, based on the child's age group; and Web browsing time limits define the days and times a child can access the Web. You can also filter (block or allow) certain Web sites for all children.

Note: To configure Parental Controls to protect your children, you must log into your computer as a Windows administrator. If you upgraded from an older version of this McAfee product and are still using McAfee users, you must also make sure you're logged in as a McAfee administrator.

In this chapter

CHAPTER 31

Configuring users

To configure Parental Controls to protect your children, you assign certain permissions to them in SecurityCenter. These permissions determine what each child can see and do on the Web.

By default, SecurityCenter users correspond to the Windows users that you have set up on your computer. However, if you upgraded from a previous version of SecurityCenter that used McAfee users, your McAfee users and their permissions are retained.

Note: To configure users, you must log into your computer as a Windows administrator. If you upgraded from an older version of this McAfee product and are still using McAfee users, you must also make sure you're logged in as a McAfee administrator.

In this chapter

| | |
|----------------------------------|-----|
| Working with Windows users | 146 |
| Working with McAfee users | 147 |

Working with Windows users

By default, SecurityCenter users correspond to the Windows users that you have set up on your computer. You add a user, edit a user's account information, or remove a user under Computer Management in Windows. You can then set up Parental Controls protection for those users in SecurityCenter.

If you upgraded from a previous version of SecurityCenter that used McAfee users, see *Working with McAfee users* (page 147).

Working with McAfee users

If you upgraded from a previous version of SecurityCenter that used McAfee users, your McAfee users and their permissions are automatically retained. You can continue to configure and manage McAfee users; however, McAfee recommends that you switch to Windows users. Once you switch to Windows users, you can never switch back to McAfee users.

If you continue using McAfee users, you can add, edit, or remove users and change or retrieve the McAfee administrator's password.

Switch to Windows users

For easy maintenance, McAfee recommends that you switch to Windows users; however, if you do, you can never switch back to McAfee users.

- 1 Open the Users Settings pane.

How?

1. Under **Common Tasks**, click **Home**.
2. On the SecurityCenter Home pane, click **Parental Controls**.
3. In the Parental Controls information section, click **Configure**.
4. On the Parental Controls Configuration pane, click **Advanced**.

- 2 On the Users Settings pane, click **Switch**.

- 3 Confirm the operation.

Add a McAfee user

After creating a McAfee user, you can configure Parental Controls protection for the user. For more information, see the Parental Controls help.

- 1 Log in to SecurityCenter as the Administrator user.

- 2 Open the Users Settings pane.

How?

1. Under **Common Tasks**, click **Home**.
 2. On the SecurityCenter Home pane, click **Parental Controls**.
 3. In the Parental Controls information section, click **Configure**.
 4. On the Parental Controls Configuration pane, click **Advanced**.
- 3 On the Users Settings pane, click **Add**.
 - 4 Follow the on-screen instructions to set up a user name, password, account type, and Parental Controls protection.
 - 5 Click **Create**.

[Edit a McAfee user's account information](#)

You can change a McAfee user's password, account type, or automatic login ability.

- 1 Log in to SecurityCenter as the Administrator user.
- 2 Open the Users Settings pane.
How?
 1. Under **Common Tasks**, click **Home**.
 2. On the SecurityCenter Home pane, click **Parental Controls**.
 3. In the Parental Controls information section, click **Configure**.
 4. On the Parental Controls Configuration pane, click **Advanced**.
- 3 On the Users Settings pane, click a user name, and then click **Edit**.
- 4 Follow the on-screen instructions to edit the user's password, account type, or Parental Controls protection.
- 5 Click **OK**.

[Remove a McAfee user](#)

You can remove a McAfee user at any time.

To remove a McAfee user:

- 1 Log in to SecurityCenter as the Administrator user.
- 2 Open the Users Settings pane.

How?

1. Under **Common Tasks**, click **Home**.
 2. On the SecurityCenter Home pane, click **Parental Controls**.
 3. In the Parental Controls information section, click **Configure**.
 4. On the Parental Controls Configuration pane, click **Advanced**.
- 3** On the Users Settings pane, under **McAfee User Accounts**, select a user name, and then click **Remove**.

Change the McAfee administrator's password

If you have trouble remembering the McAfee administrator password or suspect that it is compromised, you can change it.

- 1 Log in to SecurityCenter as the Administrator user.
- 2 Open the Users Settings pane.

How?

 1. Under **Common Tasks**, click **Home**.
 2. On the SecurityCenter Home pane, click **Parental Controls**.
 3. In the Parental Controls information section, click **Configure**.
 4. On the Parental Controls Configuration pane, click **Advanced**.
- 3 On the Users Settings pane, under **McAfee User Accounts**, select **Administrator**, and then click **Edit**.
- 4 In the Edit User Account dialog box, type a new password in the **New Password** box, and then retype it in the **Re-enter Password** box.
- 5 Click **OK**.

Retrieve the McAfee administrator's password

If you forget the Administrator password, you can retrieve it.

- 1 Right-click the SecurityCenter icon , and then click **Switch User**.
- 2 In the **User Name** list, click **Administrator**, and then click **Forgot Password?**.
- 3 Type the answer to your secret question in the **Answer** box.
- 4 Click **Submit**.

Enabling age appropriate searching

Some popular search engines (like Yahoo! and Google) offer "safe searching"—a search setting that prevents potentially inappropriate search results from appearing in their result lists. These search engines usually let you choose how restrictive you want safe search filtering to be, but also let you or any other user turn it off at any time.

In Parental Controls, age-appropriate searching is a convenient way to make sure that "safe searching" is always turned on for a user when using one of the following search engines:

- Google™
- MSN®
- Windows® Live Search
- Yahoo!®

If you enable age-appropriate searching, we'll make sure that the search engine's safe search filtering is turned on for that user and set to its most restrictive setting—and if a user tries to turn it off (in the search engine's preferences or advanced settings), we'll automatically turn it on again.

By default, age-appropriate searching is enabled for all users except administrators and those in the Adult age group. For more information about setting a user's age group, see [Setting the content rating group](#) (page 153).

Enable age-appropriate searching

By default, new users are added to the Adult group and age appropriate searching is disabled. If you want to make sure that the safe searching filtering offered by some popular search engines is turned on for an Adult user, you can enable age appropriate searching.

- 1 Open the Users Settings pane.

How?

1. On the SecurityCenter Home pane, click **Parental Controls**.
2. In the Parental Controls information section, click **Configure**.
3. On the Parental Controls Configuration pane, click **Advanced**.
4. On the Parental Controls pane, click **Users Settings**.
- 2 On the Users Settings pane, click a user name, and then click **Edit**.
- 3 In the Edit User Account window, under **Age Appropriate Searching**, click **On**.
- 4 Click **OK**.

Filtering potentially inappropriate Web images

Depending on a user's age or maturity level, you can filter (block or allow) potentially inappropriate images when the user browses the Web. For example, you can block potentially inappropriate images from appearing when your young children browse the Web, but allow them to appear for the older teenagers and adults in your home. By default, image filtering is disabled for all members of the Adult group, which means that potentially inappropriate images are visible when those users browse the Web. For more information about setting a user's age group, see [Setting the content rating group](#) (page 153).

Filter potentially inappropriate Web images

By default, new users are added to the Adult group and image filtering is disabled. If you want to block potentially inappropriate images from appearing when a particular user browses the Web, you can enable image filtering. Each potentially inappropriate Web image is automatically replaced with a static McAfee image.

- 1 Open the Users Settings pane.
How?
 1. On the SecurityCenter Home pane, click **Parental Controls**.
 2. In the Parental Controls information section, click **Configure**.
 3. On the Parental Controls Configuration pane, click **Advanced**.
 4. On the Parental Controls pane, click **Users Settings**.
- 2 On the Users Settings pane, click a user name, and then click **Edit**.
- 3 In the Edit User Account window, under **Image Filtering**, click **On**.
- 4 Click **OK**.

Setting the content rating group

A user can belong to one of the following content rating groups:

- Young child
- Child
- Younger teen
- Older teen
- Adult

Parental Controls rates (blocks or allows) Web content based on the group to which a user belongs. This lets you block or allow certain Web sites for certain users in your home. For example, you might block some Web content for users who belong to the Young child group but allow it for users who belong to the Younger teen group. If you want to rate content for a user more strictly, you can allow the user to view only those Web sites that are allowed in the **Filtered Web Sites** list. For more information, see Filtering Web sites (page 155).

Set a user's content rating group

By default, a new user is added to the Adult group, which allows the user to access all Web content. You can then adjust the user's content rating group according to the individual's age and maturity level.

1 Open the Users Settings pane.

How?

1. On the SecurityCenter Home pane, click **Parental Controls**.
2. In the Parental Controls information section, click **Configure**.
3. On the Parental Controls Configuration pane, click **Advanced**.
4. On the Parental Controls pane, click **Users Settings**.

2 On the Users Settings pane, click a user name, and then click **Edit**.

3 In the Edit User Account window, under **Content Rating**, click the age group you want to assign to the user.

4 Click **OK**.

Setting Web browsing time limits

If you are concerned about irresponsible or excessive Internet use, you can set appropriate time limits on your children's Web browsing. When you restrict Web browsing to specific times for your children, you can trust that SecurityCenter will enforce those restrictions—even when you're away from home.

By default, a child is allowed to browse the Web during all hours of the day and night, seven days a week; however, you can limit Web browsing to specific times or days or prohibit Web browsing entirely. If a child tries to browse the Web during a prohibited period, McAfee notifies the child that they cannot do so. If you prohibit Web browsing entirely, the child can log in to and use the computer, including other Internet programs such as e-mail, instant messengers, ftp, games and so on, but cannot browse the Web.

Set Web browsing time limits

You can use the Web browsing time limits grid to restrict a child's Web browsing to specific days and times.

- 1 Open the Users Settings pane.
How?
 1. On the SecurityCenter Home pane, click **Parental Controls**.
 2. In the Parental Controls information section, click **Configure**.
 3. On the Parental Controls Configuration pane, click **Advanced**.
 4. On the Parental Controls pane, click **Users Settings**.
- 2 On the Users Settings pane, click a user name, and then click **Edit**.
- 3 In the Edit User Account window, under **Web Browsing Time Limits**, drag your mouse to specify the days and times that this user cannot browse the Web.
- 4 Click **OK**.

Filtering Web sites

You can filter (block or allow) Web sites for all users except those that belong to the Adult group. You block a Web site to prevent your children from accessing it when they browse the Web. If a child tries to access a blocked Web site, a message indicates that the site cannot be accessed because it is blocked by McAfee.

You allow a Web site if McAfee has blocked it by default but you want to let your children access it. For more information about Web sites that McAfee blocks by default, see Filtering Web sites using keywords (page 158). You can also update or remove a filtered Web site at any time.

Note: Users (including Administrators) that belong to the Adult group can access all Web sites, even those that have been blocked. To test blocked Web sites, you must log in as a non-Adult user—but remember to clear your Web browser's browsing history when you're finished testing.

Block a Web site

You block a Web site to prevent your children from accessing it when they browse the Web. If a child tries to access a blocked Web site, a message appears indicating that the site cannot be accessed because it is blocked by McAfee.

1 Open the Parental Controls pane.

How?

1. On the SecurityCenter Home pane, click **Parental Controls**.
2. In the Parental Controls information section, click **Configure**.
3. On the Parental Controls Configuration pane, ensure that Parental Controls are enabled, and then click **Advanced**.

2 On the Parental Controls pane, click **Filtered Web Sites**.

3 On the Filtered Web Sites pane, type a Web site's address in the **http://** box, and then click **Block**.

4 Click **OK**.

Tip: You can block a previously allowed Web site by clicking the Web site address in the **Filtered Web Sites** list, and then clicking **Block**.

Allow a Web site

You allow a Web site to make sure that it is not blocked for any users. If you allow a Web site that McAfee has blocked by default, you override the default setting.

1 Open the Parental Controls pane.

How?

1. On the SecurityCenter Home pane, click **Parental Controls**.
2. In the Parental Controls information section, click **Configure**.
3. On the Parental Controls Configuration pane, ensure that Parental Controls are enabled, and then click **Advanced**.

2 On the Parental Controls pane, click **Filtered Web Sites**.

3 On the Filtered Web Sites pane, type a Web site's address in the **http://** box, and then click **Allow**.

4 Click **OK**.

Tip: You can allow a previously blocked Web site by clicking the Web site address in the **Filtered Web Sites** list, and then clicking **Allow**.

Update a filtered Web site

If a Web site's address changes or you enter it incorrectly when blocking or allowing it, you can update it.

1 Open the Parental Controls pane.

How?

1. On the SecurityCenter Home pane, click **Parental Controls**.
2. In the Parental Controls information section, click **Configure**.
3. On the Parental Controls Configuration pane, ensure that Parental Controls are enabled, and then click **Advanced**.

2 On the Parental Controls pane, click **Filtered Web Sites**.

3 On the Filtered Web Sites pane, click an entry in the **Filtered Web Sites** list, modify the Web site's address in the **http://** box, and then click **Update**.

4 Click **OK**.

Remove a filtered Web site

You can remove a filtered Web site if you no longer want to block or allow it.

1 Open the Parental Controls pane.

How?

1. On the SecurityCenter Home pane, click **Parental Controls**.
2. In the Parental Controls information section, click **Configure**.
3. On the Parental Controls Configuration pane, ensure that Parental Controls are enabled, and then click **Advanced**.

2 On the Parental Controls pane, click **Filtered Web Sites**.

3 On the Filtered Web Sites pane, click an entry in the **Filtered Web Sites** list, and then click **Remove**.

4 Click **OK**.

Filtering Web sites using keywords

Keyword filtering lets you block non-Adult users from visiting Web sites that contain potentially inappropriate words. When keyword filtering is enabled, a default list of keywords and corresponding rules is used to rate content for users according to their content rating group. Users must belong to a certain group to access Web sites that contain specific keywords. For example, only members of the Adult group can visit Web sites containing the word *porn*, and only members of the Child group (and older) can visit Web sites containing the word *drugs*.

You can also add your own keywords to the default list and associate these with certain content rating groups. Keyword rules that you add override a rule that might already be associated with a matching keyword in the default list.

Disable keyword filtering

By default, keyword filtering is enabled, which means that a default list of keywords and corresponding rules is used to rate content for users according to their content rating group. Although McAfee does not recommend doing so, you can disable keyword filtering at any time.

1 Open the Parental Controls pane.

How?

1. On the SecurityCenter Home pane, click **Parental Controls**.
2. In the Parental Controls information section, click **Configure**.
3. On the Parental Controls Configuration pane, ensure that Parental Controls are enabled, and then click **Advanced**.

2 On the Parental Controls pane, click **Keywords**.

3 On the Keywords pane, click **Off**.

4 Click **OK**.

Block Web sites based on keywords

If you want to block Web sites due to inappropriate content but do not know the specific site addresses, you can block the sites based on their keywords. Simply enter a keyword, and then determine which content rating groups can view Web sites that contain that keyword.

1 Open the Parental Controls pane.

How?

1. On the SecurityCenter Home pane, click **Parental Controls**.
2. In the Parental Controls information section, click **Configure**.
3. On the Parental Controls Configuration pane, ensure that Parental Controls are enabled, and then click **Advanced**.
- 2 On the Parental Controls pane, click **Keywords** and ensure that keyword filtering is enabled.
- 3 Under **Keyword List**, type a keyword in the **Look for** box.
- 4 Move the **Minimum Age** slider to specify a minimum age group.
Users in this age group and older can visit Web sites that contain the keyword.
- 5 Click **OK**.

CHAPTER 32

Protecting information on the Web

You can prevent your personal information (such as name, address, credit card numbers, and bank account numbers) from being transmitted over the Web by adding it to a protected information area.

Note: Parental Controls does not block the transmission of personal information by secure Web sites (that is, Web sites that use the https:// protocol), such as banking sites.

In this chapter

Protecting personal information..... 162

Protecting personal information

Prevent your personal information (such as name, address, credit card numbers, and bank account numbers) from being transmitted over the Web by blocking it. If McAfee detects personal information contained in something (for example, a form field or file) about to be sent across the Web, the following occurs:

- If you are an Administrator, you must confirm whether to send the information.
- If you are not an Administrator, the blocked portion is replaced with asterisks (*). For example, if a malicious Web site tries to send your credit card number to another computer, the number itself is replaced with asterisks.

Protect personal information

You can block the following types of personal information: name, address, zip code, social security information, phone number, credit card numbers, bank accounts, brokerage accounts, and phone cards. If you want to block personal information of a different type, you can set the type to **other**.

1 Open the Protected Information pane.

How?

1. Under **Common Tasks**, click **Home**.
2. On the SecurityCenter Home pane, click **Internet & Network**.
3. In the Internet & Network information section, click **Configure**.
4. On the Internet & Network Configuration pane, ensure that Personal information protection is enabled, and then click **Advanced**.

2 On the Protected Information pane, click **Add**.

3 Select the type of information you want to block in the list.

4 Enter your personal information, and then click **OK**.

CHAPTER 33

Protecting passwords

The Password Vault is a secure storage area for your personal passwords. It allows you to store your passwords with confidence so that no other user (even an Administrator) can access them.

In this chapter

Setting up the Password Vault..... 164

Setting up the Password Vault

Before you start using the Password Vault, you must set up a Password Vault password. Only users who know this password can access your Password Vault. If you forget your Password Vault password, you can reset it; however, all of the passwords that were previously stored in your Password Vault are then deleted.

After you set up a Password Vault password, you can add, edit, or remove passwords from your vault. You can also change your Password Vault password at any time.

Add a password

If you have trouble remembering your passwords, you can add them to the Password Vault. The Password Vault is a secure location that can only be accessed by users who know your Password Vault password.

- 1 Open the Password Vault pane.
How?
 1. Under **Common Tasks**, click **Home**.
 2. On the SecurityCenter Home pane, click **Internet & Network**.
 3. In the Internet & Network information section, click **Configure**.
 4. On the Internet & Network Configuration pane, click **Advanced** under **Password Vault**.
- 2 Type your Password Vault password in the **Password** box.
- 3 Click **Open**.
- 4 On the Manage Password Vault pane, click **Add**.
- 5 Type a description of the password (for example, what it is for) in the **Description** box, and then type the password in the **Password** box.
- 6 Click **OK**.

Modify a password

To ensure that the entries in your Password Vault are always accurate and reliable, you must update them when the passwords change.

- 1 Open the Password Vault pane.
How?

1. Under **Common Tasks**, click **Home**.
 2. On the SecurityCenter Home pane, click **Internet & Network**.
 3. In the Internet & Network information section, click **Configure**.
 4. On the Internet & Network Configuration pane, click **Advanced** under **Password Vault**.
- 2 Type your Password Vault password in the **Password** box.
 - 3 Click **Open**.
 - 4 On the Manage Password Vault pane, click a password entry, and then click **Edit**.
 - 5 Modify the description of the password (for example, what it is for) in the **Description** box, or modify the password in the **Password** box.
 - 6 Click **OK**.

Remove a password

You can remove a password from the Password Vault at any time. There is no way to recover a password that you remove from the vault.

- 1 Open the Password Vault pane.
How?
 1. Under **Common Tasks**, click **Home**.
 2. On the SecurityCenter Home pane, click **Internet & Network**.
 3. In the Internet & Network information section, click **Configure**.
 4. On the Internet & Network Configuration pane, click **Advanced** under **Password Vault**.
- 2 Type your Password Vault password in the **Password** box.
- 3 Click **Open**.
- 4 On the Manage Password Vault pane, click a password entry, and then click **Remove**.
- 5 In the Removal Confirmation dialog box, click **Yes**.

Change your Password Vault password

You can change your Password Vault password at any time.

- 1 Open the Password Vault pane.
How?

1. Under **Common Tasks**, click **Home**.
 2. On the SecurityCenter Home pane, click **Internet & Network**.
 3. In the Internet & Network information section, click **Configure**.
 4. On the Internet & Network Configuration pane, click **Advanced** under **Password Vault**.
- 2 On the Password Vault pane, type your current password in the **Password** box, and then click **Open**.
 - 3 On the Manage Password Vault pane, click **Change Password**.
 - 4 Type a new password in the **Choose Password** box, and then retype it in the **Re-enter Password** box.
 - 5 Click **OK**.
 - 6 In the Password Vault Password Changed dialog box, click **OK**.

[Reset your Password Vault password](#)

If you forget your Password Vault password, you can reset it; however, all the passwords you have previously entered are then deleted.

- 1 Open the Password Vault pane.
How?
 1. Under **Common Tasks**, click **Home**.
 2. On the SecurityCenter Home pane, click **Internet & Network**.
 3. In the Internet & Network information section, click **Configure**.
 4. On the Internet & Network Configuration pane, click **Advanced** under **Password Vault**.
- 2 Click **Forgot your password?**
- 3 In the Reset Password Vault dialog box, type a new password in the **Password** box, and then retype it in the **Re-enter Password** box.
- 4 Click **Reset**.
- 5 In the Reset Password Confirmation dialog box, click **Yes**.

CHAPTER 34

McAfee Backup and Restore

Use McAfee® Backup and Restore to avoid accidental loss of your data by archiving your files to CD, DVD, USB drive, external hard drive, or network drive. Local archiving allows you to archive (back up) your personal data to CD, DVD, USB drive, external hard drive, or network drive. This provides you with a local copy of your records, documents, and other materials of personal interest in case of accidental loss.

Before you begin using Backup and Restore, you can familiarize yourself with some of the most popular features. Details about configuring and using these features are provided throughout the Backup and Restore help. After browsing the program's features, you must ensure that you have adequate archive media available to perform local archives.

Note: SecurityCenter reports critical and non-critical protection problems as soon as it detects them. If you need help diagnosing your protection problems, you can run McAfee Virtual Technician.

In this chapter

| | |
|-----------------------------------|-----|
| Backup and Restore features | 168 |
| Archiving files | 169 |
| Working with archived files | 177 |

Backup and Restore features

Local scheduled archiving

Protect your data by archiving files and folders to CD, DVD, USB drive, external hard drive, or network drive. After you initiate the first archive, incremental archives occur automatically for you.

One-click restore

If files and folders are mistakenly deleted or become corrupt on your computer, you can restore the most recently archived versions from the archive media used.

Compression and encryption

By default, your archived files are compressed, which saves space on your archive media. As an additional security measure, your archives are encrypted by default.

CHAPTER 35

Archiving files

You can use McAfee Backup and Restore to archive a copy of the files on your computer to CD, DVD, USB drive, external hard drive, or network drive. Archiving your files in this way makes it easy for you to retrieve information in case of accidental data loss or damage.

Before you start archiving files, you must choose your default archive location (CD, DVD, USB drive, external hard drive, or network drive). McAfee has preset some other settings; for example, the folders and file types that you want to archive, but you can modify those settings.

After you set the local archive options, you can modify the default settings for how often Backup and Restore runs full or quick archives. You can run manual archives at any time.

In this chapter

| | |
|--|-----|
| Enabling and disabling local archive | 170 |
| Setting archive options | 171 |
| Running full and quick archives | 175 |

Enabling and disabling local archive

The first time you launch Backup and Restore, you decide whether to enable or disable local archive, depending on how you want to use Backup and Restore. Once you sign in and start using Backup and Restore, you can enable or disable local archiving at any time.

If you do not want to archive a copy of the files on your computer to CD, DVD, USB drive, external hard drive, or network drive, you can disable local archive.

Enable local archive

You enable local archive if you want to archive a copy of the files on your computer to CD, DVD, USB drive, external hard drive, or network drive.

- 1 In SecurityCenter, on the **Advanced Menu**, click **Configure**.
- 2 On the Configure pane, click **Computer & Files**.
- 3 On the Computer & Files Configuration pane, under **Local Archive is disabled**, click **On**.

Disable local archive

You disable local archive if you do not want to archive a copy of the files on your computer to CD, DVD, USB drive, external hard drive, or network drive.

- 1 In SecurityCenter, on the **Advanced Menu**, click **Configure**.
- 2 On the Configure pane, click **Computer & Files**.
- 3 On the Computer & Files Configuration pane, under **Local Archive is enabled**, click **Off**.

Setting archive options

Before you start archiving your files, you must set some local archive options. For example, you must set up the watch locations and watch file types. Watch locations are the folders on your computer that Backup and Restore monitors for new files or file changes. Watch file types are the types of files (for example, .doc, .xls, and so on) that Backup and Restore archives within the watch locations. By default, the following file types are archived; however, you can also archive other file types.

- Microsoft® Word documents (.doc, .docx)
- Microsoft Excel® spreadsheets (.xls, .xlsx)
- Microsoft PowerPoint® presentations (.ppt, .pptx)
- Microsoft Project® files (.mpp)
- Adobe® PDF files (.pdf)
- Plain text files (.txt)
- HTML files (.html)
- Joint Photographic Experts Group files (.jpg, .jpeg)
- Tagged Image Format files (.tif)
- MPEG Audio Stream III files (.mp3)
- Video files (.vdo)

Note: You cannot archive the following file types: .ost, and .pst.

You can set up two types of watch locations: top-level folders and subfolders, and top-level folders only. If you set up a top-level folders and subfolders location, Backup and Restore archives the watch file types within that folder and its subfolders. If you set up a top-level folders location, Backup and Restore archives the watch file types within that folder only (not its subfolders). You can also identify locations that you want to exclude from the local archive. By default, the Windows Desktop and My Documents locations are set up as top-level folders and subfolders watch locations.

After you set up the watch file types and locations, you must set up the archive location (that is, the CD, DVD, USB drive, external hard drive, or network drive where archived data will be stored). You can change the archive location at any time.

For security reasons or size issues, encryption or compression are enabled by default for your archived files. The content of encrypted files is transformed from text to code, obscuring the information to make it unreadable by people who do not know how to decrypt it. Compressed files are compressed into a form that minimizes the space required to store or transmit it. Although McAfee does not recommend doing so, you can disable encryption or compression at any time.

Include a location in the archive

You can set two types of watch locations for archiving: top-level folders and subfolders, and top-level folders only. If you set a top-level folders and subfolders location, Backup and Restore monitors the contents of the folder and its subfolders for changes. If you set a top-level folders location, Backup and Restore monitors the contents of folder only (not its subfolders).

- 1 Open the Local Archive Settings dialog box.
How?
 1. Click the **Local Archive** tab.
 2. In the left pane, click **Settings**.
- 2 Click **Watch Locations**.
- 3 Do one of the following:
 - To archive the contents of a folder, including the contents of its subfolders, click **Add Folder** under **Archive Top-Level Folders and Subfolders**.
 - To archive the contents of a folder, but not the contents of its subfolders, click **Add Folder** under **Archive Top-Level Folders**.
 - To archive an entire file, click **Add File** under **Archive Top-Level Folders**.
- 4 In the Browse For Folder (or Open) dialog box, navigate to the folder (or file) that you want to watch, and then click **OK**.
- 5 Click **OK**.

Tip: If you want Backup and Restore to watch a folder that you have not yet created, you can click **Make New Folder** in the Browse For Folder dialog box to add a folder and set it as a watch location at the same time.

Set archive file types

You can specify which types of files are archived within your top-level folders and subfolders or top-level folders locations. You can choose from an existing list of file types or add a new type to the list.

- 1 Open the Local Archive Settings dialog box.
How?

1. Click the **Local Archive** tab.
 2. In the left pane, click **Settings**.
- 2 Click **File Types**.
 - 3 Expand the file types lists, and select the check boxes beside the file types that you want to archive.
 - 4 Click **OK**.

Tip: To add a new file type to the **Selected File Types** list, type the file extension in the **Add custom file type to Other** box, click **Add**, and then click **OK**. The new file type automatically becomes a watch file type.

Exclude a location from the archive

You exclude a location from the archive if you want to prevent that location (folder) and its contents from being archived.

- 1 Open the Local Archive Settings dialog box.
How?
 1. Click the **Local Archive** tab.
 2. In the left pane, click **Settings**.
- 2 Click **Watch Locations**.
- 3 Click **Add Folder** under **Folders Excluded From Backup**.
- 4 In the Browse For Folder dialog box, navigate to the folder that you want to exclude, select it, and then click **OK**.
- 5 Click **OK**.

Tip: If you want Backup and Restore to exclude a folder that you have not yet created, you can click **Make New Folder** in the Browse For Folder dialog box to add a folder and exclude it at the same time.

Change the archive location

When you change the archive location, files previously archived in a different location are listed as *Never Archived*.

- 1 Open the Local Archive Settings dialog box.
How?
 1. Click the **Local Archive** tab.
 2. In the left pane, click **Settings**.
- 2 Click **Change Archive Location**.
- 3 In the Archive Location dialog box, do one of the following:
 - Click **Select CD/DVD Writer**, click your computer's CD or DVD drive in the **Writer** list, and then click **OK**.

- Click **Select Drive Location**, navigate to a USB drive, local drive, or external hard drive, select it, and then click **OK**.
 - Click **Select Network Location**, navigate to a network folder, select it, and then click **OK**.
- 4 Verify the new archive location under **Selected Archive Location**, and then click **OK**.
 - 5 In the confirmation dialog box, click **OK**.
 - 6 Click **OK**.

Note: When you change the archive location, files previously archived are listed as **Not Archived** in the **State** column.

Disable archive encryption and compression

Encrypting archived files protects the confidentiality of your data by obscuring the content of the files so that they are unreadable. Compressing archived files helps to minimize the size of the files. By default, both encryption and compression are enabled; however, you can disable these options at any time.

- 1 Open the Local Archive Settings dialog box.
 - How?
 1. Click the **Local Archive** tab.
 2. In the left pane, click **Settings**.
- 2 Click **Advanced Settings**.
- 3 Clear the **Enable encryption to increase security** check box.
- 4 Clear the **Enable compression to reduce storage space** check box.
- 5 Click **OK**.

Note: McAfee recommends that you do not disable encryption and compression when archiving your files.

Running full and quick archives

You can run two types of archive: full or quick. When you run a full archive, you archive a complete set of data based on the watch file types and locations that you have set up. When you run a quick archive, you archive only those watched files that have changed since the last full or quick archive.

By default, Backup and Restore is scheduled to run a full archive of the watch file types in your watch locations every Monday at 9:00 a.m and a quick archive every 48 hours after the last full or quick archive. This schedule ensures that a current archive of your files is maintained at all times. However, if you do not want to archive every 48 hours, you can adjust the schedule to suit your needs.

If you want to archive the contents of your watch locations on demand, you can do so at any time. For example, if you modify a file and want to archive it, but Backup and Restore is not scheduled to run a full or quick archive for another few hours, you can archive the files manually. When you archive files manually, the interval that you set for automatic archives is reset.

You can also interrupt an automatic or manual archive if it occurs at an inappropriate time. For example, if you are performing a resource-intensive task and an automatic archive starts, you can stop it. When you stop an automatic archive, the interval that you set for automatic archives is reset.

Schedule automatic archives

You can set the frequency of full and quick archives to ensure that your data is always protected.

1 Open the Local Archive Settings dialog box.

How?

1. Click the **Local Archive** tab.
2. In the left pane, click **Settings**.

2 Click **General**.

3 To run a full archive each day, week, or month, click one of the following under **Full archive Every**:

- **Day**
- **Week**
- **Month**

- 4 Select the check box beside the day on which you want to run the full archive.
- 5 Click a value in the **At** list to specify the time at which you want to run the full archive.
- 6 To run a quick archive on a daily or hourly basis, click one of the following under **Quick Archive**:
 - **Hours**
 - **Days**
- 7 Type a number representing the frequency in the **Quick archive Every** box.
- 8 Click **OK**.

Note: You can disable a scheduled archive by selecting **Manual** under **Full Archive Every**.

Interrupt an automatic archive

Backup and Restore automatically archives the files and folders in your watch locations according to the schedule that you define. However, if an automatic archive is in progress and you want to interrupt it, you can do so at any time.

- 1 In the left pane, click **Stop Archiving**.
- 2 In the confirmation dialog box, click **Yes**.

Note: The **Stop Archiving** link only appears when an archive is in progress.

Run archives manually

Although automatic archives run according to a predefined schedule, you can run a quick or full archive manually at any time. A quick archive archives only those files that have changed since the last full or quick archive. A full archive archives the watch file types in all watch locations.

- 1 Click the **Local Archive** tab.
- 2 Do one of the following:
 - To run a quick archive, click **Quick Archive** in the left pane.
 - To run a full archive, click **Full Archive** in the left pane.
- 3 In the Start Archiving dialog box, verify your storage space and settings, and then click **Continue**.

CHAPTER 36

Working with archived files

After you archive some files, you can use Backup and Restore to work with them. Your archived files are presented to you in a traditional explorer view which allows you to locate them easily. As your archive grows, you might want to sort the files or search for them. You can also open files directly in the explorer view to examine the content without having to retrieve the files.

You retrieve files from an archive if your local copy of the file is out of date, missing, or corrupt. Backup and Restore also provides you with the information you need to manage your local archives and storage media.

In this chapter

| | |
|---------------------------------------|-----|
| Using the local archive explorer..... | 178 |
| Restoring archived files..... | 180 |
| Managing archives | 182 |

Using the local archive explorer

The local archive explorer allows you to view and manipulate the files that you have archived locally. You can view each file's name, type, location, size, state (archived, not archived, or archive in progress), and the date on which each file was last archived. You can also sort the files by any of these criteria.

If you have a large archive, you can find a file quickly by searching for it. You can search for all or part of a file's name or path and can then narrow your search by specifying the approximate file size and the date on which it was last archived.

After you locate a file, you can open it directly in the local archive explorer. Backup and Restore opens the file in its native program, allowing you to make changes without leaving the local archive explorer. The file is saved to the original watch location on your computer and is archived automatically according to the archive schedule you have defined.

Sort archived files

You can sort your archived files and folders by the following criteria: name, file type, size, state (that is, archived, not archived, or archive in progress), the date on which the files were last archived, or the location of the files on your computer (path).

- 1 Click the **Local Archive** tab.
- 2 In the right pane, click a column name.

Search for an archived file

If you have a large repository of archived files, you can find a file quickly by searching for it. You can look for all or part of a file's name or path and can then narrow your search by specifying the approximate file size and the date on which it was last archived.

- 1 Type all or part of the file name in the **Search** box at the top of the screen, and then press ENTER.
- 2 Type all or part of the path in the **All or part of the path** box.
- 3 Specify the approximate size of the file that you are searching for by doing one of the following:
 - Click **Less than 100 KB**, **Less than 1 MB**, or **More than 1 MB**.
 - Click **Size in KB**, and then specify the appropriate size values in the boxes.
- 4 Specify the approximate date of the file's last archive by doing one of the following:
 - Click **This Week**, **This Month**, or **This Year**.
 - Click **Specify Dates**, click **Archived** in the list, and then click the appropriate date values from the date lists.

5 Click **Search**.

Note: If you do not know the approximate size or date of the last archive, click **Unknown**.

Open an archived file

You can examine the content of an archived file by opening it directly in the local archive explorer.

- 1 Click the **Local Archive** tab.
- 2 In the right pane, click a file name, and then click **Open**.

Tip: You can also open an archived file by double-clicking the file name.

Restoring archived files

If a watch file becomes corrupt, is missing, or is mistakenly deleted, you can restore a copy of it from a local archive. For this reason, it is important to ensure that you archive your files regularly. You can also restore older versions of files from a local archive. For example, if you regularly archive a file, but want to revert to a previous version of a file, you can do so by locating the file in the archive location. If the archive location is a local drive or network drive, you can browse for the file. If the archive location is an external hard drive or USB drive, you must connect the drive to the computer, and then browse for the file. If the archive location is a CD or DVD, you must insert the CD or DVD in the computer, and then browse for the file.

You can also restore files that you have archived on one computer from a different computer. For example, if you archive a set of files to an external hard drive on computer A, you can restore those files on computer B. To do so, you must install Backup and Restore on computer B and connect the external hard drive. Then, in Backup and Restore, you browse for the files and they are added to the **Missing Files** list for restoration.

For more information about archiving files, see Archiving files. If you intentionally delete a watch file from your archive, you can also delete the entry from the **Missing Files** list.

Restore missing files from a local archive

Backup and Restore's local archive allows you to recover data that is missing from a watch folder on your local computer. For example, if a file is moved out of a watch folder or deleted, and has already been archived, you can restore it from the local archive.

- 1 Click the **Local Archive** tab.
- 2 On the **Missing Files** tab at the bottom of the screen, select the check box beside the name of the file that you want to restore.
- 3 Click **Restore**.

Tip: You can restore all the files in the **Missing Files** list by clicking **Restore All**.

Restore an older version of a file from a local archive

If you want to restore an older version of an archived file, you can locate it and add it to the **Missing Files** list. Then, you can restore the file, as you would any other file in the **Missing Files** list.

- 1 Click the **Local Archive** tab.
- 2 On the **Missing Files** tab at the bottom of the screen, click **Browse**, and then navigate to the location where the archive is stored.
- 3 Select the location, and then click **OK**.

Remove files from the missing files list

When an archived file is moved out of a watch folder or deleted, it automatically appears in the **Missing Files** list. This alerts you to the fact that there is an inconsistency between the files archived and the files contained in the watch folders. If the file was moved out of the watched folder or deleted intentionally, you can delete the file from the **Missing Files** list.

- 1 Click the **Local Archive** tab.
- 2 On the **Missing Files** tab at the bottom of the screen, select the check box beside the name of the file that you want to remove.
- 3 Click **Delete**.

Tip: You can remove all the files in the **Missing Files** list by clicking **Delete All**.

Managing archives

You can view a summary of information about your full and quick archives at any time. For example, you can view information about the amount of data currently being watched, the amount of data that has been archived, and the amount of data that is currently being watched but has not yet been archived. You can also view information about your archive schedule, such as the date on which the last and next archives occur.

View a summary of your archive activity

You can view information about your archive activity at any time. For example, you can view the percentage of files that have been archived, the size of the data being watched, the size of the data that has been archived, and the size of the data that is being watched but has not yet been archived. You can also view the dates on which the last and next archives occur.

- 1 Click the **Local Archive** tab.
- 2 At the top of the screen, click **Account Summary**.

CHAPTER 37

McAfee QuickClean

QuickClean improves your computer's performance by deleting files that can create clutter on your computer. It empties your Recycle Bin and deletes temporary files, shortcuts, lost file fragments, registry files, cached files, cookies, browser history files, sent and deleted e-mail, recently used files, Active-X files, and system restore point files. QuickClean also protects your privacy by using the McAfee Shredder component to securely and permanently delete items that may contain sensitive, personal information, such as your name and address. For information about shredding files, see McAfee Shredder.

Disk Defragmenter arranges files and folders on your computer to ensure that they do not become scattered (that is, fragmented) when saved on your computer's hard drive. By defragmenting your hard drive periodically, you ensure that these fragmented files and folders are consolidated for quick retrieval later.

If you do not want to maintain your computer manually, you can schedule both QuickClean and Disk Defragmenter to run automatically, as independent tasks, at any frequency.

Note: SecurityCenter reports critical and non-critical protection problems as soon as it detects them. If you need help diagnosing your protection problems, you can run McAfee Virtual Technician.

| Defragmenting your computer | 189 |
| Scheduling a task..... | 191 |

QuickClean features

File Cleaner

Delete unnecessary files safely and efficiently using various cleaners. By deleting these files, you increase the space on your computer's hard drive and improve its performance.

CHAPTER 38

Cleaning your computer

QuickClean deletes files that can create clutter on your computer. It empties your Recycle Bin and deletes temporary files, shortcuts, lost file fragments, registry files, cached files, cookies, browser history files, sent and deleted email, recently-used files, Active-X files, and system restore point files. QuickClean deletes these items without affecting other essential information.

You can use any of QuickClean's cleaners to delete unnecessary files from your computer. The following table describes the QuickClean cleaners:

| Name | Function |
|----------------------------|--|
| Recycle Bin Cleaner | Deletes files in the Recycle Bin. |
| Temporary Files Cleaner | Deletes files stored in temporary folders. |
| Shortcut Cleaner | Deletes broken shortcuts and shortcuts that do not have a program associated with them. |
| Lost File Fragment Cleaner | Deletes lost file fragments on your computer. |
| Registry Cleaner | Deletes Windows® registry information for programs that no longer exist on your computer. The registry is a database in which Windows stores its configuration information. The registry contains profiles for each computer user and information about system hardware, installed programs, and property settings. Windows continually references this information during its operation. |
| Cache Cleaner | Deletes cached files that accumulate as you browse web pages. These files are usually stored as temporary files in a cache folder. A cache folder is a temporary storage area on your computer. To increase web browsing speed and efficiency, your browser can retrieve a web page from its cache (rather than from a remote server) the next time you want to view it. |

| Name | Function |
|---|---|
| Cookie Cleaner | <p>Deletes cookies. These files are usually stored as temporary files.</p> <p>A cookie is a small file containing information, usually including a user name and the current date and time, stored on the computer of a person browsing the web. Cookies are primarily used by websites to identify users who have previously registered on or visited the site; however, they can also be a source of information for hackers.</p> |
| Browser History Cleaner | Deletes your web browser history. |
| Outlook Express and Outlook E-mail Cleaner (sent and deleted items) | Deletes sent and deleted email from Outlook® and Outlook Express. |
| Recently Used Cleaner | <p>Deletes recently used files that have been created with any of these programs:</p> <ul style="list-style-type: none"> ▪ Adobe Acrobat® ▪ Corel® WordPerfect® Office (Corel Office) ▪ Jasc® ▪ Lotus® ▪ Microsoft® Office® ▪ RealPlayer™ ▪ Windows History ▪ Windows Media Player ▪ WinRAR® ▪ WinZip® |
| ActiveX Cleaner | <p>Deletes ActiveX controls.</p> <p>ActiveX is a software component used by programs or web pages to add functionality that blends in and appears as a normal part of the program or web page. Most ActiveX controls are harmless; however, some may capture information from your computer.</p> |
| System Restore Point Cleaner | <p>Deletes old system restore points (except the most recent one) from your computer.</p> <p>System restore points are created by Windows to mark any changes made to your computer so that you can revert to a previous state if any problems occur.</p> |

In this chapter

Clean your computer 187

Clean your computer

You can use any of QuickClean's cleaners to delete unnecessary files from your computer. When finished, under **QuickClean Summary**, you can view the amount of disk space reclaimed after cleanup, the number of files that were deleted, and the date and time when the last QuickClean operation ran on your computer.

- 1 On the McAfee SecurityCenter pane, under **Common Tasks**, click **Maintain Computer**.
- 2 Under **McAfee QuickClean**, click **Start**.
- 3 Do one of the following:
 - Click **Next** to accept the default cleaners in the list.
 - Select or clear the appropriate cleaners, and then click **Next**. If you select the Recently Used Cleaner, you can click **Properties** to select or clear the files that have been recently created with the programs in the list, and then click **OK**.
 - Click **Restore Defaults** to restore the default cleaners, and then click **Next**.
- 4 After the analysis is performed, click **Next**.
- 5 Click **Next** to confirm the file deletion.
- 6 Do one of the following:
 - Click **Next** to accept the default **No, I want to delete files using standard Windows deletion**.
 - Click **Yes, I want to securely erase my files using Shredder**, specify the number of passes, up to 10, and then click **Next**. Shredding files can be a lengthy process if there is a large amount of information being erased.
- 7 If any files or items were locked during cleanup, you may be prompted to restart your computer. Click **OK** to close the prompt.
- 8 Click **Finish**.

Note: Files deleted with Shredder cannot be recovered. For information about shredding files, see McAfee Shredder.

CHAPTER 39

Defragmenting your computer

Disk Defragmenter arranges files and folders on your computer so that they do not become scattered (that is, fragmented) when saved on your computer's hard drive. By defragmenting your hard drive periodically, you ensure that these fragmented files and folders are consolidated for quick retrieval later.

In this chapter

Defragment your computer..... 189

Defragment your computer

You can defragment your computer to improve file and folder access and retrieval.

- 1 On the McAfee SecurityCenter pane, under **Common Tasks**, click **Maintain Computer**.
- 2 Under **Disk Defragmenter**, click **Analyze**.
- 3 Follow the on-screen instructions.

Note: For more information about Disk Defragmenter, see the Windows Help.

CHAPTER 40

Scheduling a task

Task Scheduler automates the frequency with which QuickClean or Disk Defragmenter runs on your computer. For example, you can schedule a QuickClean task to empty your Recycle Bin every Sunday at 9:00 P.M. or a Disk Defragmenter task to defragment your computer's hard drive on the last day of every month. You can create, modify, or delete a task at any time. You must be logged in to your computer for a scheduled task to run. If a task does not run for any reason, it will be rescheduled five minutes after you log in again.

In this chapter

| | |
|--|-----|
| Schedule a QuickClean task | 191 |
| Modify a QuickClean task..... | 192 |
| Delete a QuickClean task..... | 193 |
| Schedule a Disk Defragmenter task..... | 193 |
| Modify a Disk Defragmenter task | 194 |
| Delete a Disk Defragmenter task..... | 195 |

Schedule a QuickClean task

You can schedule a QuickClean task to automatically clean your computer using one or more cleaners. When finished, under **QuickClean Summary**, you can view the date and time when your task is scheduled to run again.

- 1 Open the Task Scheduler pane.
How?
 1. On the McAfee SecurityCenter, under **Common Tasks**, click **Maintain Computer**.
 2. Under **Task Scheduler**, click **Start**.
- 2 In the **Select operation to schedule** list, click **McAfee QuickClean**.
- 3 Type a name for your task in the **Task name** box, and then click **Create**.
- 4 Do one of the following:
 - Click **Next** to accept the cleaners in the list.
 - Select or clear the appropriate cleaners, and then click **Next**. If you select the Recently Used Cleaner, you can click **Properties** to select or clear the files that have been recently created with the programs in the list, and then click **OK**.

- Click **Restore Defaults** to restore the default cleaners, and then click **Next**.
- 5 Do one of the following:
 - Click **Schedule** to accept the default **No, I want to delete files using standard Windows deletion**.
 - Click **Yes, I want to securely erase my files using Shredder**, specify the number of passes, up to 10, and then click **Schedule**.
 - 6 In the **Schedule** dialog box, select the frequency with which you want the task to run, and then click **OK**.
 - 7 If you made changes to the Recently Used Cleaner properties, you may be prompted to restart your computer. Click **OK** to close the prompt.
 - 8 Click **Finish**.

Note: Files deleted with Shredder cannot be recovered. For information about shredding files, see McAfee Shredder.

Modify a QuickClean task

You can modify a scheduled QuickClean task to change the cleaners it uses or the frequency with which it automatically runs on your computer. When finished, under **QuickClean Summary**, you can view the date and time when your task is scheduled to run again.

- 1 Open the Task Scheduler pane.

How?

 1. On the McAfee SecurityCenter, under **Common Tasks**, click **Maintain Computer**.
 2. Under **Task Scheduler**, click **Start**.
- 2 In the **Select operation to schedule** list, click **McAfee QuickClean**.
- 3 Select the task in the **Select an existing task** list, and then click **Modify**.
- 4 Do one of the following:
 - Click **Next** to accept the cleaners selected for the task.
 - Select or clear the appropriate cleaners, and then click **Next**. If you select the Recently Used Cleaner, you can click **Properties** to select or clear the files that have been recently created with the programs in the list, and then click **OK**.
 - Click **Restore Defaults** to restore the default cleaners, and then click **Next**.

- 5 Do one of the following:
 - Click **Schedule** to accept the default **No, I want to delete files using standard Windows deletion**.
 - Click **Yes, I want to securely erase my files using Shredder**, and specify the number of passes, up to 10, and then click **Schedule**.
- 6 In the **Schedule** dialog box, select the frequency with which you want the task to run, and then click **OK**.
- 7 If you made changes to the Recently Used Cleaner properties, you may be prompted to restart your computer. Click **OK** to close the prompt.
- 8 Click **Finish**.

Note: Files deleted with Shredder cannot be recovered. For information about shredding files, see McAfee Shredder.

Delete a QuickClean task

You can delete a scheduled QuickClean task if you no longer want it to run automatically.

- 1 Open the Task Scheduler pane.

How?

 1. On the McAfee SecurityCenter, under **Common Tasks**, click **Maintain Computer**.
 2. Under **Task Scheduler**, click **Start**.
- 2 In the **Select operation to schedule** list, click **McAfee QuickClean**.
- 3 Select the task in the **Select an existing task** list.
- 4 Click **Delete**, and then click **Yes** to confirm the deletion.
- 5 Click **Finish**.

Schedule a Disk Defragmenter task

You can schedule a Disk Defragmenter task to schedule the frequency with which your computer's hard drive is automatically defragmented. When finished, under **Disk Defragmenter**, you can view the date and time when your task is scheduled to run again.

- 1 Open the Task Scheduler pane.

How?

1. On the McAfee SecurityCenter, under **Common Tasks**, click **Maintain Computer**.
2. Under **Task Scheduler**, click **Start**.
- 2 In the **Select operation to schedule** list, click **Disk Defragmenter**.
- 3 Type a name for your task in the **Task name** box, and then click **Create**.
- 4 Do one of the following:
 - Click **Schedule** to accept the default **Perform defragmentation even if the free space is low** option.
 - Clear the **Perform defragmentation even if the free space is low** option, and then click **Schedule**.
- 5 In the **Schedule** dialog box, select the frequency with which you want the task to run, and then click **OK**.
- 6 Click **Finish**.

Modify a Disk Defragmenter task

You can modify a scheduled Disk Defragmenter task to change the frequency with which it automatically runs on your computer. When finished, under **Disk Defragmenter**, you can view the date and time when your task is scheduled to run again.

- 1 Open the Task Scheduler pane.

How?

 1. On the McAfee SecurityCenter, under **Common Tasks**, click **Maintain Computer**.
 2. Under **Task Scheduler**, click **Start**.
- 2 In the **Select operation to schedule** list, click **Disk Defragmenter**.
- 3 Select the task in the **Select an existing task** list, and then click **Modify**.
- 4 Do one of the following:
 - Click **Schedule** to accept the default **Perform defragmentation even if the free space is low** option.
 - Clear the **Perform defragmentation even if the free space is low** option, and then click **Schedule**.
- 5 In the **Schedule** dialog box, select the frequency with which you want the task to run, and then click **OK**.
- 6 Click **Finish**.

Delete a Disk Defragmenter task

You can delete a scheduled Disk Defragmenter task if you no longer want it to run automatically.

- 1** Open the Task Scheduler pane.
How?
 1. On the McAfee SecurityCenter, under **Common Tasks**, click **Maintain Computer**.
 2. Under **Task Scheduler**, click **Start**.
- 2** In the **Select operation to schedule** list, click **Disk Defragmenter**.
- 3** Select the task in the **Select an existing task** list.
- 4** Click **Delete**, and then click **Yes** to confirm the deletion.
- 5** Click **Finish**.

CHAPTER 41

McAfee Shredder

McAfee Shredder deletes (or shreds) items permanently from your computer's hard drive. Even when you manually delete files and folders, empty your Recycle Bin, or delete your Temporary Internet Files folder, you can still recover this information using computer forensic tools. As well, a deleted file can be recovered because some programs make temporary, hidden copies of open files. Shredder protects your privacy by safely and permanently deleting these unwanted files. It's important to remember that shredded files cannot be restored.

Note: SecurityCenter reports critical and non-critical protection problems as soon as it detects them. If you need help diagnosing your protection problems, you can run McAfee Virtual Technician.

In this chapter

| | |
|--|-----|
| Shredder features | 198 |
| Shredding files, folders, and disks..... | 199 |

Shredder features

Permanently delete files and folders

Remove items from your computer's hard drive so that their associated information cannot be recovered. It protects your privacy by safely and permanently deleting files and folders, items in your Recycle Bin and Temporary Internet Files folder, and the entire contents of computer disks, such as rewritable CDs, external hard drives, and floppy disks.

Shredding files, folders, and disks

Shredder ensures that the information contained in deleted files and folders in your Recycle Bin and in your Temporary Internet Files folder cannot be recovered, even with special tools. With Shredder, you can specify how many times (up to 10) you want an item to be shredded. A higher number of shredding passes increases your level of secure file deletion.

Shred files and folders

You can shred files and folders from your computer's hard drive, including items in your Recycle Bin and in your Temporary Internet Files folder.

1 Open **Shredder**.

How?

1. On the McAfee SecurityCenter pane, under **Common Tasks**, click **Advanced Menu**.
2. On the left pane, click **Tools**.
3. Click **Shredder**.

2 On the Shred files and folders pane, under **I want to**, click **Erase files and folders**.

3 Under **Shredding Level**, click one of the following shredding levels:

- **Quick**: Shreds the selected item(s) once.
- **Comprehensive**: Shreds the selected item(s) 7 times.
- **Custom**: Shreds the selected item(s) up to 10 times.

4 Click **Next**.

5 Do one of the following:

- In the **Select file(s) to shred** list, click either **Recycle Bin contents** or **Temporary Internet files**.
- Click **Browse**, navigate to the file that you want to shred, select it, and then click **Open**.

6 Click **Next**.

7 Click **Start**.

8 When Shredder finishes, click **Done**.

Note: Do not work with any files until Shredder has completed the task.

Shred an entire disk

You can shred the entire contents of a disk at once. Only removable drives, such as external hard drives, writeable CDs, and floppy disks can be shredded.

1 Open **Shredder**.

How?

1. On the McAfee SecurityCenter pane, under **Common Tasks**, click **Advanced Menu**.
2. On the left pane, click **Tools**.
3. Click **Shredder**.

2 On the Shred files and folders pane, under **I want to**, click **Erase an entire disk**.

3 Under **Shredding Level**, click one of the following shredding levels:

- **Quick**: Shreds the selected drive once.
- **Comprehensive**: Shreds the selected drive 7 times.
- **Custom**: Shreds the selected drive up to 10 times.

4 Click **Next**.

5 In the **Select the disk** list, click the drive that you want to shred.

6 Click **Next**, and then click **Yes** to confirm.

7 Click **Start**.

8 When Shredder finishes, click **Done**.

Note: Do not work with any files until Shredder has completed the task.

CHAPTER 42

McAfee Network Manager

Network Manager presents a graphical view of the computers and other devices that make up your home network. You can use Network Manager to remotely manage the protection status of each managed computer in your network, and remotely fix reported security vulnerabilities on those computers. If you've installed McAfee Total Protection, Network Manager can also monitor your network for Intruders (computers or devices that you don't recognize or trust) that try to connect to it.

Before you use Network Manager, you can familiarize yourself with some of the features. Details about configuring and using these features are provided throughout the Network Manager help.

Note: SecurityCenter reports critical and non-critical protection problems as soon as it detects them. If you need help diagnosing your protection problems, you can run McAfee Virtual Technician.

In this chapter

| | |
|---|-----|
| Network Manager features | 202 |
| Understanding Network Manager icons | 203 |
| Setting up a managed network..... | 205 |
| Managing the network remotely..... | 211 |
| Monitoring your networks..... | 217 |

Network Manager features

- Graphical network map** View a graphical overview of the protection status of the computers and devices that make up your home network. When you make changes to your network (for example, add a computer), the network map recognizes those changes. You can refresh the network map, rename the network, and show or hide components of the network map to customize your view. You can also view the details for any of the devices on the network map.
- Remote management** Manage the protection status of the computers that make up your home network. You can invite a computer to join the managed network, monitor the managed computer's protection status, and fix known security vulnerabilities for a remote computer on the network.
- Network monitoring** If it is available, let Network Manager monitor your networks and notify you when Friends or Intruders connect. Network monitoring is only available if you've purchased McAfee Total Protection.

Understanding Network Manager icons

The following table describes the icons commonly used on the Network Manager network map.

| Icon | Description |
|---|---|
|  | Represents an online, managed computer |
|  | Represents an offline, managed computer |
|  | Represents an unmanaged computer that has SecurityCenter installed |
|  | Represents an offline, unmanaged computer |
|  | Represents an online computer that does not have SecurityCenter installed, or an unknown network device |
|  | Represents an offline computer that does not have SecurityCenter installed, or an offline, unknown network device |
|  | Signifies that the corresponding item is protected and connected |
|  | Signifies that the corresponding item may require your attention |
|  | Signifies that the corresponding item requires your immediate attention |
|  | Represents a wireless home router |
|  | Represents a standard home router |
|  | Represents the Internet, when connected |
|  | Represents the Internet, when disconnected |

CHAPTER 43

Setting up a managed network

To set up a managed network, trust the network (if you haven't already) and add members (computers) to the network. Before a computer can be remotely managed, or granted permission to remotely manage other computers on the network, it must become a trusted member of the network. Network membership is granted to new computers by existing network members (computers) with administrative permissions.

You can view the details associated with any of the items that appear on the network map, even after you make changes to your network (for example, you add a computer).

In this chapter

| | |
|-----------------------------------|-----|
| Working with the network map..... | 206 |
| Joining the managed network..... | 208 |

Working with the network map

When you connect a computer to the network, Network Manager analyzes the network to determine if there are any managed or unmanaged members, what the router attributes are, and the Internet status. If no members are found, Network Manager assumes that the currently connected computer is the first computer on the network and makes the computer a managed member with administrative permissions. By default, the name of the network includes the name of the first computer that connects to the network and has SecurityCenter installed; however, you can rename the network at any time.

When you make changes to your network (for example, you add a computer), you can customize the network map. For example, you can refresh the network map, rename the network, and show or hide items on the network map to customize your view. You can also view the details associated with any of the items that appear on the network map.

Access the network map

The network map provides a graphical representation of the computers and devices that make up your home network.

- On the Basic or Advanced Menu, click **Manage Network**.

Note: If you haven't already trusted the network (using McAfee Personal Firewall), you are prompted to do so the first time that you access the network map.

Refresh the network map

You can refresh the network map at any time; for example, after another computer joins the managed network.

- 1 On the Basic or Advanced Menu, click **Manage Network**.
- 2 Click **Refresh network map** under **I want to**.

Note: The **Refresh network map** link is only available if there are no items selected on the network map. To clear an item, click the selected item, or click an area of white space on the network map.

Rename the network

By default, the name of the network includes the name of the first computer that connects to the network and has SecurityCenter installed. If you prefer to use a different name, you can change it.

- 1 On the Basic or Advanced Menu, click **Manage Network**.
- 2 Click **Rename network** under **I want to**.
- 3 Type the name of the network in the **Network Name** box.
- 4 Click **OK**.

Note: The **Rename network** link is only available if there are no items selected on the network map. To clear an item, click the selected item, or click an area of white space on the network map.

Show or hide an item on the network map

By default, all the computers and devices in your home network appear on the network map. However, if you have hidden items, you can show them again at any time. Only unmanaged items can be hidden; managed computers cannot be hidden.

| | |
|--------------------------------------|--|
| To... | On the Basic or Advanced Menu, click Manage Network , and then do this... |
| Hide an item on the network map | Click an item on the network map, and then click Hide this item under I want to . In the confirmation dialog box, click Yes . |
| Show hidden items on the network map | Under I want to , click Show hidden items . |

View details for an item

You can view detailed information about any item on your network if you select it on the network map. This information includes the item name, its protection status, and other information required to manage the item.

- 1 Click an item's icon on the network map.
- 2 Under **Details**, view the information about the item.

Joining the managed network

Before a computer can be remotely managed or granted permission to remotely manage other computers on the network, it must become a trusted member of the network. Network membership is granted to new computers by existing network members (computers) with administrative permissions. To ensure that only trusted computers join the network, users at the granting and joining computers must authenticate each other.

When a computer joins the network, it is prompted to expose its McAfee protection status to other computers on the network. If a computer agrees to expose its protection status, it becomes a managed member of the network. If a computer refuses to expose its protection status, it becomes an unmanaged member of the network. Unmanaged members of the network are usually guest computers that want to access other network features (for example, send files or share printers).

Note: After you join, if you have other McAfee networking programs installed (for example, EasyNetwork), the computer is also recognized as a managed computer in those programs. The permission level that is assigned to a computer in Network Manager applies to all McAfee networking programs. For more information about what guest, full, or administrative permissions mean in other McAfee networking programs, see the documentation provided for that program.

Join a managed network

When you receive an invitation to join a managed network, you can accept it or reject it. You can also determine whether you want the other computers on the network to manage this computer's security settings.

- 1 In the Managed Network dialog box, ensure that the **Allow every computer on this network to manage security settings** check box is selected.
- 2 Click **Join**.
When you accept the invitation, two playing cards appear.
- 3 Confirm that the playing cards are the same as those displayed on the computer that invited you to join the managed network.
- 4 Click **OK**.

Note: If the computer that invited you to join the managed network does not display the same playing cards that appear in the security confirmation dialog box, there has been a security breach on the managed network. Joining the network can place your computer at risk; therefore, click **Cancel** in the Managed Network dialog box.

Invite a computer to join the managed network

If a computer is added to the managed network, or another unmanaged computer exists on the network, you can invite that computer to join the managed network. Only computers with administrative permissions on the network can invite other computers to join. When you send the invitation, you also specify the permission level you want to assign to the joining computer.

- 1 Click an unmanaged computer's icon in the network map.
- 2 Click **Manage this computer** under **I want to**.
- 3 In the Invite a computer to join the managed network dialog box, do one of the following:
 - Click **Allow guest access to managed network programs** to allow the computer access to the network (you can use this option for temporary users in your home).
 - Click **Allow full access to managed network programs** to allow the computer access to the network.
 - Click **Allow administrative access to managed network programs** to allow the computer access to the network with administrative permissions. It also allows the computer to grant access to other computers that want to join the managed network.
- 4 Click **OK**.

An invitation to join the managed network is sent to the computer. When the computer accepts the invitation, two playing cards appear.
- 5 Confirm that the playing cards are the same as those displayed on the computer that you have invited to join the managed network.
- 6 Click **Grant Access**.

Note: If the computer you invited to join the managed network does not display the same playing cards that appear in the security confirmation dialog box, there has been a security breach on the managed network. Allowing the computer to join the network can place other computers at risk; therefore, click **Reject Access** in the security confirmation dialog box.

Stop trusting computers on the network

If you trusted other computers on the network by mistake, you can stop trusting them.

- Click **Stop trusting computers on this network** under **I want to**.

Note: The **Stop trusting computers on this network** link is not available if you have administrative permissions and there are other managed computers on the network.

CHAPTER 44

Managing the network remotely

After you set up your managed network, you can remotely manage the computers and devices that make up your network. You can manage the status and permission levels of the computers and devices and fix most security vulnerabilities remotely.

In this chapter

| | |
|---------------------------------------|-----|
| Managing status and permissions | 212 |
| Fixing security vulnerabilities | 214 |

Managing status and permissions

A managed network has managed and unmanaged members. Managed members allow other computers on the network to manage their McAfee protection status; unmanaged members do not. Unmanaged members are usually guest computers that want to access other network features (for example, send files or share printers). An unmanaged computer can be invited to become a managed computer at any time by another managed computer with administrative permissions on the network. Similarly, a managed computer with administrative permissions can make another managed computer unmanaged at any time.

Managed computers have administrative, full, or guest permissions. Administrative permissions allow the managed computer to manage the protection status of all other managed computers on the network and grant other computers membership to the network. Full and guest permissions allow a computer to access the network only. You can modify a computer's permission level at any time.

Since a managed network can also have devices (for example, routers), you can use Network Manager to manage them. You can also configure and modify a device's display properties on the network map.

Manage a computer's protection status

If a computer's protection status is not being managed on the network (the computer is not a member, or is an unmanaged member), you can request to manage it.

- 1 Click an unmanaged computer's icon on the network map.
- 2 Click **Manage this computer** under **I want to**.

Stop managing a computer's protection status

You can stop managing the protection status of a managed computer in your network; however, the computer then becomes unmanaged and you cannot manage its protection status remotely.

- 1 Click a managed computer's icon on the network map.
- 2 Click **Stop managing this computer** under **I want to**.
- 3 In the confirmation dialog box, click **Yes**.

Modify a managed computer's permissions

You can change a managed computer's permissions at any time. This allows you to modify which computers can manage the protection status of other computers on the network.

- 1 Click a managed computer's icon on the network map.
- 2 Click **Modify permissions for this computer** under **I want to**.
- 3 In the modify permissions dialog box, select or clear the check box to determine whether this computer and other computers on the managed network can manage each other's protection status.
- 4 Click **OK**.

Manage a device

You can manage a device by accessing its administration Web page from the network map.

- 1 Click a device's icon on the network map.
- 2 Click **Manage this device** under **I want to**.
A Web browser opens and displays the device's administration Web page.
- 3 In your Web browser, provide your login information and configure the device's security settings.

Note: If the device is a Wireless Network Security protected wireless router or access point, you must use McAfee Wireless Network Security to configure the device's security settings.

Modify a device's display properties

When you modify a device's display properties, you can change the device's display name on the network map and specify whether the device is a wireless router.

- 1 Click a device's icon on the network map.
- 2 Click **Modify device properties** under **I want to**.
- 3 To specify the device's display name, type a name in the **Name** box.
- 4 To specify the type of device, click **Standard Router** if it is not a wireless router, or **Wireless Router** if it is wireless.
- 5 Click **OK**.

Fixing security vulnerabilities

Managed computers with administrative permissions can manage the McAfee protection status of other managed computers on the network and fix reported security vulnerabilities remotely. For example, if a managed computer's McAfee protection status indicates that VirusScan is disabled, another managed computer with administrative permissions can enable VirusScan remotely.

When you fix security vulnerabilities remotely, Network Manager repairs most reported issues. However, some security vulnerabilities may require manual intervention on the local computer. In this case, Network Manager fixes the issues that can be repaired remotely, and then prompts you to fix the remaining issues by logging in to SecurityCenter on the vulnerable computer and following the recommendations provided. In some cases, the suggested resolution is to install the latest version of SecurityCenter on the remote computer or computers on your network.

Fix security vulnerabilities

You can use Network Manager to fix most security vulnerabilities on remote, managed computers. For example, if VirusScan is disabled on a remote computer, you can enable it.

- 1 Click an item's icon on the network map.
- 2 View the item's protection status, under **Details**.
- 3 Click **Fix security vulnerabilities** under **I want to**.
- 4 When the security issues have been fixed, click **OK**.

Note: Although Network Manager automatically fixes most security vulnerabilities, some repairs may require you to open SecurityCenter on the vulnerable computer and follow the recommendations provided.

Install McAfee security software on remote computers

If one or more computers on your network is not using a recent version of SecurityCenter, their protection status cannot be managed remotely. If you want to manage these computers remotely, you must go to each computer, and install a recent version of SecurityCenter.

- 1** Make sure that you are following these instructions on the computer that you want to manage remotely.
- 2** Have your McAfee login information handy—this is the e-mail address and password used the first time the McAfee software was activated.
- 3** In a browser, go to the McAfee Web site, log in, and click **My Account**.
- 4** Find the product you want to install, click its **Download** button, and then follow the on-screen instructions.

Tip: You can also learn how to install McAfee security software on remote computers by opening your network map, and clicking **Protect my PCs** under **I want to**.

CHAPTER 45

Monitoring your networks

If you have McAfee Total Protection installed, Network Manager also monitors your networks for intruders. Each time an unknown computer or device connects to your network, you'll be notified about it so you can decide whether that computer or device is a Friend or an Intruder. A Friend is a computer or device that you recognize and trust, and an Intruder is a computer or device that you don't recognize or trust. If you mark a computer or device as a Friend, you can decide whether you want to be notified each time that Friend connects to the network. If you mark a computer or device as an Intruder, we'll automatically alert you each time it connects.

The first time you connect to a network after installing or upgrading to this version of Total Protection, we'll automatically mark each computer or device as a Friend and we won't notify you when they connect to the network in the future. After three days, we'll start notifying you about each unknown computer or device that connects so that you can mark them yourself.

Note: Network monitoring is a feature of Network Manager that is only available with McAfee Total Protection. For more information about Total Protection, visit our Web site.

In this chapter

| | |
|--|-----|
| Stop detecting new Friends | 217 |
| Mark as Friend..... | 218 |
| Mark as Intruder..... | 218 |
| Re-enabling network monitoring notifications | 218 |
| Stop monitoring networks..... | 219 |

Stop detecting new Friends

For the first three days after you connect to a network with this version of Total Protection installed, we'll automatically mark each computer or device as a Friend that you don't want to be notified about. You can stop this automatic marking at any time within those three days, but you can't restart it later.

- 1 On the Basic or Advanced Menu, click **Manage Network**.
- 2 Under **I want to**, click **Stop detecting new Friends**.

Mark as Friend

Mark a computer or device on your network as a Friend only if you recognize and trust it. When you mark a computer or device as a Friend, you can also decide whether or not you want to be notified each time it connects to the network.

- 1 On the Basic or Advanced Menu, click **Manage Network**.
- 2 On the network map, click an item.
- 3 Under **I want to**, click **Mark as Friend or Intruder**.
- 4 In the dialog box, click **A Friend**.
- 5 To be notified each time this Friend connects to the network, select the **Notify me when this computer or device connects to the network** check box.

Mark as Intruder

Mark a computer or device on your network as an Intruder if you don't recognize or trust it. We'll automatically alert you each time it connects to your network.

- 1 On the Basic or Advanced Menu, click **Manage Network**.
- 2 On the network map, click an item.
- 3 Under **I want to**, click **Mark as Friend or Intruder**.
- 4 In the dialog box, click **An Intruder**.

Re-enabling network monitoring notifications

Although you can disable networking monitoring notifications, we don't recommend it. If you do so, we may no longer be able to tell you when unknown computers or Intruders connect to your network. If you inadvertently disable these notifications (for example, if you select the **Do not show this alert again** check box in an alert), you can re-enable them at any time.

- 1 Open the Alert Options pane.
How?

1. Under **Common Tasks**, click **Home**.
2. On the right pane, under **SecurityCenter Information**, click **Configure**.
3. Under **Alerts**, click **Advanced**.
- 2 On the SecurityCenter Configuration pane, click **Informational Alerts**.
- 3 On the Informational Alerts pane, make sure the following check boxes are clear:
 - **Don't show alerts when new PCs or devices connect to the network**
 - **Don't show alerts when Intruders connect to the network**
 - **Don't show alerts for Friends that I usually want to be notified about**
 - **Don't remind me when unknown PCs or devices are detected**
 - **Don't alert me when McAfee has finished detecting new Friends**
- 4 Click **OK**.

Stop monitoring networks

If you disable network monitoring, we can no longer alert you if intruders connect to your home network or any other network that you connect to.

- 1 Open the Internet & Network Configuration pane.

How?

 1. Under **Common Tasks**, click **Home**.
 2. On the SecurityCenter Home pane, click **Internet & Network**.
 3. In the Internet & Network information section, click **Configure**.
- 2 Under **Network monitoring**, click **Off**.

CHAPTER 46

McAfee EasyNetwork

EasyNetwork allows you to share files securely, simplify file transfers, and share printers among the computers in your home network. However, the computers in your network must have EasyNetwork installed to access its features.

Before you use EasyNetwork, you can familiarize yourself with some of the features. Details about configuring and using these features are provided throughout the EasyNetwork help.

Note: SecurityCenter reports critical and non-critical protection problems as soon as it detects them. If you need help diagnosing your protection problems, you can run McAfee Virtual Technician.

In this chapter

| | |
|--------------------------------|-----|
| EasyNetwork features | 222 |
| Setting up EasyNetwork..... | 223 |
| Sharing and sending files..... | 229 |
| Sharing printers..... | 235 |

EasyNetwork features

- File sharing** Easily share files with other computers on your network. When you share files, you grant other computers read-only access to those files. Only computers that have full or administrative access to your managed network (members) can share or access files shared by other members.
- File transfer** Send files to other computers that have full or administrative access to your managed network (members). When you receive a file, it appears in your EasyNetwork inbox. The inbox is a temporary storage location for all the files other computers on the network send to you.
- Automated printer sharing** Join a managed network, so you can share any local printers attached to your computer with other members, using the printer's current name as the shared printer name. EasyNetwork also detects printers shared by other computers on your network and allows you to configure and use those printers.

CHAPTER 47

Setting up EasyNetwork

Before you can use EasyNetwork, you must open it and join a managed network. After you join a managed network, you can share, search for, and send files to other computers on the network. You can also share printers. If you decide to leave the network, you can do so at any time.

In this chapter

| | |
|--------------------------------|-----|
| Open EasyNetwork | 223 |
| Joining a managed network..... | 224 |
| Leaving a managed network..... | 228 |

Open EasyNetwork

You can open EasyNetwork from your Windows Start menu or by clicking its desktop icon.

- On the **Start** menu, point to **Programs**, point to **McAfee**, and then click **McAfee EasyNetwork**.

Tip: You can also open EasyNetwork by double-clicking the McAfee EasyNetwork icon on your desktop.

Joining a managed network

If no computers on the network you are connected to have SecurityCenter, you are made a member of the network and are prompted to identify whether the network is trusted. As the first computer to join the network, your computer name is included in the network name; however, you can rename the network at any time.

When a computer connects to the network, it sends a join request to the other computers on the network. The request can be granted by any computer with administrative permissions on the network. The grantor can also determine the permission level for the computer that joins the network; for example, guest (file transfer only) or full/administrative (file transfer and file sharing). In EasyNetwork, computers with administrative access can grant access to other computers and manage permissions (promote or demote computers); computers with full access cannot perform these administrative tasks.

Note: After you join, if you have other McAfee networking programs installed (for example, Network Manager), the computer is also recognized as a managed computer in those programs. The permission level that is assigned to a computer in EasyNetwork applies to all McAfee networking programs. For more information about what guest, full, or administrative permissions mean in other McAfee networking programs, see the documentation provided for that program.

Join the network

When a computer connects to a trusted network for the first time after installing EasyNetwork, a message appears asking whether to join the managed network. If the computer agrees to join, a request is sent to all the other computers on the network that have administrative access. This request must be granted before the computer can share printers or files, or send and copy files on the network. The first computer on the network is automatically granted administrative permissions.

- 1** In the Shared Files window, click **Join this network**.
When an administrative computer on the network grants your request, a message appears, asking whether to allow this computer and other computers on the network to manage each others' security settings.
- 2** To allow this computer and other computers on the network to manage each others' security settings, click **OK**; otherwise, click **Cancel**.
- 3** Confirm that the granting computer displays the playing cards that appear in the security confirmation dialog box, and then click **OK**.

Note: If the computer that invited you to join the managed network does not display the same playing cards that appear in the security confirmation dialog box, there has been a security breach on the managed network. Joining the network can place your computer at risk; therefore, click **Cancel** in the security confirmation dialog box.

Grant access to the network

When a computer requests to join the managed network, a message is sent to the other computers on the network that have administrative access. The first computer that responds becomes the grantor. As the grantor, you are responsible for deciding which type of access to grant the computer: guest, full, or administrative.

- 1** In the alert, click the appropriate access level.
- 2** In the Invite a computer to join the managed network dialog box, do one of the following:
 - Click **Allow guest access to managed network programs** to allow the computer access to the network (you can use this option for temporary users in your home).
 - Click **Allow full access to managed network programs** to allow the computer access to the network.

- Click **Allow administrative access to managed network programs** to allow the computer access to the network with administrative permissions. It also allows the computer to grant access to other computers that want to join the managed network.

3 Click **OK**.

4 Confirm that the computer is displaying the playing cards that appear in the security confirmation dialog box, and then click **Grant Access**.

Note: If the computer does not display the same playing cards that appear in the security confirmation dialog box, there has been a security breach on the managed network. Granting this computer access to the network can place your computer at risk; therefore, click **Reject Access** in the security confirmation dialog box.

Rename the network

By default, the network name includes the name of the first computer that joined; however, you can change the network name at any time. When you rename the network, you change the network description displayed in EasyNetwork.

- 1 On the **Options** menu, click **Configure**.
- 2 In the Configure dialog box, type the name of the network in the **Network Name** box.
- 3 Click **OK**.

Leaving a managed network

If you join a managed network but then decide that you do not want to be a member, you can leave the network. After you leave the managed network, you can always rejoin; however, you must be granted permission again. For more information about joining, see [Joining a managed network](#) (page 224).

Leave a managed network

You can leave a managed network that you previously joined.

- 1 Disconnect your computer from the network.
- 2 In EasyNetwork, on the **Tools** menu, click **Leave Network**.
- 3 In the Leave Network dialog box, select the name of the network that you want to leave.
- 4 Click **Leave Network**.

CHAPTER 48

Sharing and sending files

EasyNetwork makes it easy to share and send files among other computers on the network. When you share files, you grant other computers read-only access to them. Only computers that are members of the managed network (full or administrative access) can share or access files shared by other member computers.

Note: If you are sharing a large number of files, your computer resources may be affected.

In this chapter

| | |
|--|-----|
| Sharing files | 230 |
| Sending files to other computers | 233 |

Sharing files

Only computers that are members of the managed network (full or administrative access) can share or access files shared by other member computers. If you share a folder, all the files contained in that folder and its subfolders are shared; however, subsequent files added to the folder are not automatically shared. If a shared file or folder is deleted, it is removed from the Shared Files window. You can stop sharing a file at any time.

To access a shared file, open the file directly from EasyNetwork or copy it to your computer, and then open it from there. If your list of shared files is large and it's difficult to see where the file is, you can search for it.

Note: Files shared with EasyNetwork cannot be accessed from other computers using Windows Explorer because EasyNetwork file sharing must be performed over secure connections.

Share a file

When you share a file, it is available to all members with full or administrative access to the managed network.

- 1 In Windows Explorer, locate the file you want to share.
- 2 Drag the file from its location in Windows Explorer to the Shared Files window in EasyNetwork.

Tip: You can also share a file if you click **Share Files** on the **Tools** menu. In the Share dialog box, navigate to the folder where the file you want to share is stored, select it, and then click **Share**.

Stop sharing a file

If you share a file on the managed network, you can stop sharing it at any time. When you stop sharing a file, other members of the managed network cannot access it.

- 1 On the **Tools** menu, click **Stop Sharing Files**.
- 2 In the Stop Sharing Files dialog box, select the file that you no longer want to share.
- 3 Click **OK**.

Copy a shared file

You copy a shared file so that you still have it when it's not shared any more. You can copy a shared file from any computer on your managed network.

- Drag a file from the Shared Files window in EasyNetwork to a location in Windows Explorer or to the Windows desktop.

Tip: You can also copy a shared file if you select the file in EasyNetwork, and then click **Copy To** on the **Tools** menu. In the Copy to folder dialog box, navigate to the folder where you want to copy the file, select it, and then click **Save**.

Search for a shared file

You can search for a file that has been shared by you or any other network member. As you type your search criteria, EasyNetwork displays the corresponding results in the Shared Files window.

- 1 In the Shared Files window, click **Search**.
- 2 Click the appropriate option (page 231) in the **Contains** list.
- 3 Type part or all of the file name or path in the **File or Path Name** list.
- 4 Click the appropriate file type (page 231) in the **Type** list.
- 5 In the **From** and **To** lists, click the dates that represent the range of dates when the file was created.

Search criteria

The following tables describe the search criteria you can specify when searching for shared files.

Name of the file or path

| Contains | Description |
|---------------------------|--|
| Contains all of the words | Search for a file or path name that contains all the words you specify in the File or Path Name list, in any order. |
| Contains any of the words | Search for a file or path name that contains any words you specify in the File or Path Name list. |
| Contains the exact string | Search for a file or path name that contains the exact phrase you specify in the File or Path Name list. |

Type of file

| Type | Description |
|-------------|--|
| Any | Search all shared file types. |
| Document | Search all shared documents. |
| Image | Search all shared image files. |
| Video | Search all shared video files. |
| Audio | Search all shared audio files. |
| Compressed | Search all compressed files (for example, .zip files). |

Sending files to other computers

You can send files to other computers that are members of the managed network. Before sending a file, EasyNetwork confirms that the computer receiving the file has enough disk space available.

When you receive a file, it appears in your EasyNetwork inbox. The inbox is a temporary storage location for the files that other computers on the network send you. If you have EasyNetwork open when you receive a file, the file instantly appears in your inbox; otherwise, a message appears in the notification area at the far right of your taskbar. If you do not want to receive notification messages (for example, they are interrupting what you're doing), you can turn this feature off. If a file with the same name already exists in the inbox, the new file is renamed with a numeric suffix. Files remain in your inbox until you accept them (copy them to your computer).

Send a file to another computer

You can send a file to another computer on the managed network without sharing it. Before a user on the recipient computer can view the file, it must be saved to a local location. For more information, see [Accept a file from another computer](#) (page 233).

- 1 In Windows Explorer, locate the file you want to send.
- 2 Drag the file from its location in Windows Explorer to an active computer icon in EasyNetwork.

Tip: To send multiple files to a computer, press CTRL when selecting the files. You can also send files if you click **Send** on the **Tools** menu, select the files, and then click **Send**.

Accept a file from another computer

If another computer on the managed network sends you a file, you must accept it by saving it on your computer. If EasyNetwork is not running when a file is sent to your computer, you receive a notification message in the notification area at the far right of your taskbar. Click the notification message to open EasyNetwork and access the file.

- Click **Received**, and then drag the file from your EasyNetwork inbox to a folder in Windows Explorer.

Tip: You can also receive a file from another computer if you select the file in your EasyNetwork inbox, and then click **Accept** on the **Tools** menu. In the Accept to folder dialog box, navigate to the folder where you want to save the files you are receiving, select it, and then click **Save**.

Receive notification when a file is sent

You can receive a notification message when another computer on the managed network sends you a file. If EasyNetwork is not running, the notification message appears in the notification area at the far right of your taskbar.

- 1 On the **Options** menu, click **Configure**.
- 2 In the Configure dialog box, select the **Notify me when another computer sends me files** check box.
- 3 Click **OK**.

CHAPTER 49

Sharing printers

After you join a managed network, EasyNetwork shares the local printers attached to your computer and uses the printer's name as the shared printer name. EasyNetwork also detects printers shared by other computers on your network and allows you to configure and use them.

If you have configured a printer driver to print through a network print server (for example, a wireless USB print server), EasyNetwork considers the printer to be a local printer and shares it on the network. You can also stop sharing a printer at any time.

In this chapter

Working with shared printers.....236

Working with shared printers

EasyNetwork detects the printers that are shared by the computers on the network. If EasyNetwork detects a remote printer that is not connected to your computer, the **Available network printers** link appears in the Shared Files window when you open EasyNetwork for the first time. You can then install available printers or uninstall printers that are already connected to your computer. You can also refresh the list of printers to ensure that you are viewing up-to-date information.

If you have not joined the managed network but are connected to it, you can access the shared printers from the Windows printer control panel.

Stop sharing a printer

When you stop sharing a printer, members cannot use it.

- 1 On the **Tools** menu, click **Printers**.
- 2 In the Manage Network Printers dialog box, click the name of the printer that you no longer want to share.
- 3 Click **Do Not Share**.

Install an available network printer

If you are a member of the managed network, you can access the printers that are shared; however, you must install the printer driver used by the printer. If the owner of the printer stops sharing their printer, you cannot use it.

- 1 On the **Tools** menu, click **Printers**.
- 2 In the Available Network Printers dialog box, click a printer name.
- 3 Click **Install**.

Reference

The Glossary of Terms lists and defines the most commonly used security terminology found in McAfee products.

Glossary

8

802.11

A set of standards for transmitting data across a wireless network. 802.11 is commonly known as Wi-Fi.

802.11a

An extension to 802.11 that transmits data at up to 54 Mbps in the 5GHz band. Although the transmission speed is faster than 802.11b, the distance covered is much less.

802.11b

An extension to 802.11 that transmits data at up to 11 Mbps in the 2.4 GHz band. Although the transmission speed is slower than 802.11a, the distance covered is greater.

802.1x

A standard for authentication on wired and wireless networks. 802.1x is commonly used with 802.11 wireless networking. See also authentication (page 239).

A

access point (AP)

A network device (commonly called a wireless router) that plugs into an Ethernet hub or switch to extend the physical range of service for a wireless user. When wireless users roam with their mobile devices, transmission passes from one access point to another to maintain connectivity.

ActiveX control

A software component used by programs or web pages to add functionality that appears as a normal part of the program or web page. Most ActiveX controls are harmless; however, some might capture information from your computer.

archive

To create a copy of important files on CD, DVD, USB drive, external hard drive, or network drive. Compare to back up (page 239).

authentication

The process of verifying the digital identity of the sender of an electronic communication.

B

back up

To create a copy of important files, typically on a secure online server. Compare to archive (page 239).

bandwidth

The amount of data (throughput) that can be transmitted in a fixed period of time.

blacklist

In Anti-Spam, a list of email addresses you do not want to receive messages from because you believe the messages will be spam. In anti-phishing, a list of websites that are considered fraudulent. Compare to *whitelist* (page 250).

browser

A program used to view web pages on the Internet. Popular web browsers include Microsoft Internet Explorer and Mozilla Firefox.

brute-force attack

A hacking method used to find passwords or encryption keys by trying every possible combination of characters until it breaks encryption.

buffer overflow

A condition that occurs in an operating system or an application when suspicious programs or processes try to store more data in a buffer (temporary storage area) than it can hold. A buffer overflow corrupts memory or overwrites data in adjacent buffers.

C

cache

A temporary storage area on your computer for frequently or recently accessed data. For example, to increase web browsing speed and efficiency, your browser can retrieve a web page from its cache, rather than from a remote server, the next time you want to view it.

cipher text

Encrypted text. Cipher text is unreadable until it has been converted into plain text (that is, decrypted). See also *encryption* (page 241).

client

A program that runs on a personal computer or workstation and relies on a server to perform some operations. For example, an email client is an application that lets you send and receive email.

compression

A process that compresses files into a form that minimizes the space required for storing or transmitting.

content-rating group

In Parental Controls, an age group to which a user belongs. Content is made available or blocked based on the content-rating group to which a user belongs. Content-rating groups include: Young Child, Child, Younger Teenager, Older Teenager, and Adult.

cookie

A small text file used by many websites to store information about pages visited, stored on the computer of a person browsing the web. It might contain login or registration information, shopping cart information, or user preferences. Cookies are primarily used by websites to identify users who have previously registered on or visited the website; however, they can also be a source of information for hackers.

D

DAT

Detection definition files, also called signature files, containing the definitions that identify, detect, and repair viruses, Trojan horses, spyware, adware, and other potentially unwanted programs (PUPs).

denial-of-service (DOS) attack

A type of attack against a computer, server or network that slows or halts traffic on a network. It occurs when a network is flooded with so many additional requests that regular traffic is slowed or completely interrupted. A denial-of-service attack overwhelms its target with false connection requests, so that the target ignores legitimate requests.

dialers

Software that redirects Internet connections to a party other than the user's default ISP (Internet service provider) to run up additional connection charges for a content provider, vendor, or other third party.

dictionary attack

A type of brute-force attack that uses common words to try to discover a password.

DNS

Domain Name System. A database system that translates an IP address, such as 11.2.3.44, into a domain name, such as www.mcafee.com.

domain

A local subnetwork or a descriptor for sites on the Internet. On a local area network (LAN), a domain is a subnetwork made up of client and server computers controlled by one security database. On the Internet, a domain is part of every web address. For example, in www.mcafee.com, mcafee is the domain.

E

email

Electronic mail. Messages sent and received electronically, across a computer network. See also webmail (page 250).

email client

A program that you run on your computer to send and receive email (for example, Microsoft Outlook).

encryption

A method of encoding information so that unauthorized parties cannot access it. When the data is encoded, the process uses a “key” and mathematical algorithms. Encrypted information cannot be decrypted without the proper key. Viruses sometimes use encryption in an attempt to escape detection.

ESS

Extended service set. Two or more networks that form a single subnetwork.

event

In a computer system or program, an incident or occurrence that can be detected by security software, according to predefined criteria. Typically an event triggers an action, such as sending a notification or adding an entry to an event log.

external hard drive

A hard drive that is stored outside of the computer.

F

file fragments

Remnants of a file scattered throughout a disk. File fragmentation occurs as files are added or deleted, and can slow your computer’s performance.

firewall

A system (hardware, software, or both) designed to prevent unauthorized access to or from a private network. Firewalls are frequently used to prevent unauthorized Internet users from accessing private networks connected to the Internet, especially an intranet. All messages entering or leaving the intranet pass through the firewall, which examines each message and blocks those that do not meet the specified security criteria.

H

home network

Two or more computers that are connected in a home so that they can share files and Internet access. See also LAN (page 243).

hotspot

A geographic boundary covered by a Wi-Fi (802.11) access point (AP). Users who enter a hotspot with a wireless laptop can connect to the Internet, provided that the hotspot is “beaconing” (advertising its presence) and authentication is not required. Hotspots are often located in heavily populated areas such as airports.

I

integrated gateway

A device that combines the functions of an access point (AP), router, and firewall. Some devices also include security enhancements and bridging features.

intranet

A private computer network, usually inside an organization, that can be accessed only by authorized users.

IP address

Internet Protocol address. An address used to identify a computer or device on a TCP/IP network. The format of an IP address is a 32-bit numeric address written as four numbers separated by periods. Each number can be 0 to 255 (for example, 192.168.1.100).

IP spoofing

Forging the IP addresses in an IP packet. This is used in many types of attacks including session hijacking. It is also often used to fake the email headers of spam so they cannot be properly traced.

K

key

A series of letters and numbers used by two devices to authenticate their communication. Both devices must have the key. See also WEP (page 250), WPA (page 251), WPA2 (page 251), WPA2-PSK (page 251), WPA-PSK (page 251).

L

LAN

Local Area Network. A computer network that spans a relatively small area (for example, a single building). Computers on a LAN can communicate with each other and share resources such as printers and files.

launchpad

A U3 interface component that acts as a starting point for launching and managing U3 USB programs.

M

MAC address

Media Access Control address. A unique serial number assigned to a physical device (NIC, network interface card) accessing the network.

man-in-the-middle attack

A method of intercepting and possibly modifying messages between two parties without either party knowing that their communication link has been breached.

MAPI

Messaging Application Programming Interface. A Microsoft interface specification that allows different messaging and workgroup programs (including email, voicemail, and fax) to work through a single client, such as the Exchange client.

message authentication code (MAC)

A security code used to encrypt messages that are transmitted between computers. The message is accepted if the computer recognizes the decrypted code as valid.

MSN

Microsoft Network. A group of web-based services offered by Microsoft Corporation, including a search engine, email, instant messaging, and portal.

N

network

A collection of IP-based systems (such as routers, switches, servers, and firewalls) that are grouped as a logical unit. For example, a “Finance Network” might include all of the servers, routers, and systems that service a finance department. See also home network (page 242).

network drive

A disk or tape drive that is connected to a server on a network that is shared by multiple users. Network drives are sometimes called “remote drives”.

network map

A graphical representation of the computers and components that make up a home network.

NIC

Network Interface Card. A card that plugs into a laptop or other device and connects the device to the LAN.

node

A single computer connected to a network.

O

on-demand scanning

A scheduled examination of selected files, applications, or network devices to find a threat, vulnerability, or other potentially unwanted code. It can take place immediately, at a scheduled time in the future, or at regularly-scheduled intervals. Compare to on-access scanning. See also vulnerability.

P

password

A code (usually consisting of letters and numbers) you use to gain access to your computer, a program, or a website.

password vault

A secure storage area for your personal passwords. It allows you to store your passwords with confidence that no other user (even an administrator) can access them.

PCI wireless adapter card

Peripheral Component Interconnect. A wireless adapter card that plugs into a PCI expansion slot inside the computer.

phishing

A method of fraudulently obtaining personal information, such as passwords, social security numbers, and credit card details, by sending spoofed emails that look like they come from trusted sources, such as banks or legitimate companies. Typically, phishing emails request that recipients click the link in the email to verify or update contact details or credit card information.

plain text

Text that is not encrypted. See also encryption (page 241).

plugin, plug-in

A small software program that adds features to or enhances a larger piece of software. For example, plug-ins permit a web browser to access and execute files embedded in HTML documents that are in formats the browser normally would not recognize, such as animation, video, and audio files.

POP3

Post Office Protocol 3. An interface between an email client program and the email server. Most home users have a POP3 email account, also known as standard email account.

popups

Small windows that appear on top of other windows on your computer screen. Pop-up windows are often used in web browsers to display advertisements.

port

A hardware location for passing data in and out of a computing device. Personal computers have various types of ports, including internal ports for connecting disk drives, monitors, and keyboards, as well as external ports for connecting modems, printers, mice, and other peripherals.

potentially unwanted program (PUP)

A software program that might be unwanted, despite the possibility that users consented to download it. It can alter the security or the privacy settings of the computer on which it is installed. PUPs can — but does not necessarily — include spyware, adware, and dialers, and might be downloaded with a program that the user wants.

PPPoE

Point-to-Point Protocol Over Ethernet. A method of using the Point-to-Point Protocol (PPP) dial-up protocol with Ethernet as the transport.

protocol

A set of rules enabling computers or devices to exchange data. In a layered network architecture (Open Systems Interconnection model), each layer has its own protocols that specify how communication takes place at that level. Your computer or device must support the correct protocol to communicate with other computers. See also Open Systems Interconnection (OSI).

proxy

A computer (or the software that runs on it) that acts as a barrier between a network and the Internet by presenting only a single network address to external sites. By representing all internal computers, the proxy protects network identities while still providing access to the Internet. See also proxy server (page 245).

proxy server

A firewall component that manages Internet traffic to and from a local area network (LAN). A proxy server can improve performance by supplying frequently requested data, such as a popular web page, and can filter and discard requests that the owner does not consider appropriate, such as requests for unauthorized access to proprietary files.

publish

The process of making a backed-up file available publicly, on the Internet. You can access published files by searching the Backup and Restore library.

Q

quarantine

Enforced isolation of a file or folder suspected of containing a virus, spam, suspicious content, or potentially unwanted programs (PUPs), so that the files or folders cannot be opened or executed.

R

RADIUS

Remote Access Dial-In User Service. A protocol that allows user authentication, usually in the context of remote access. Originally defined for use with dial-in remote access servers, it is now used in a variety of authentication environments, including 802.1x authentication of a WLAN user's shared secret. See also A string or key (usually a password) that has been shared between two communicating parties prior to initiating communication. It is used to protect sensitive portions of RADIUS messages. See also RADIUS (page 246).

real-time scanning

The process of scanning files and folders for viruses and other activity when they are accessed by you or your computer.

Recycle Bin

A simulated garbage can for deleted files and folders in Windows.

registry

A database used by Windows to store its configuration information for each computer user, system hardware, installed programs, and property settings. The database is broken down into keys, for which values are set. Unwanted programs can change the value of registry keys or create new ones, to execute malicious code.

roaming

Moving from one access point (AP) coverage area to another without interruption in service or loss in connectivity.

rogue access point

An unauthorized access point. Rogue access points can be installed on a secure company network to grant network access to unauthorized parties. They can also be created to allow an attacker to conduct a man-in-the-middle attack.

rootkit

A collection of tools (programs) that grant a user administrator-level access to a computer or computer network. Rootkits might include spyware and other potentially unwanted programs that can create additional security or privacy risks to your computer data and personal information.

router

A network device that forwards data packets from one network to another. Routers read each incoming packet and decide how to forward it based on source and destination addresses and current traffic conditions. A router is sometimes called an access point (AP).

S

script

A list of commands that can be executed automatically (that is, without user interaction). Unlike programs, scripts are typically stored in their plain text form and compiled each time they are run. Macros and batch files are also called scripts.

server

A computer or program that accepts connections from other computers or programs and returns appropriate responses. For example, your email program connects to an email server each time you send or receive email messages.

share

Allowing email recipients access to selected backed-up files for a limited period of time. When you share a file, you send the backed-up copy of the file to the email recipients that you specify. Recipients receive an email message from Backup and Restore indicating that files have been shared with them. The email also contains a link to the shared files.

shared secret

A string or key (usually a password) that has been shared between two communicating parties prior to initiating communication. It is used to protect sensitive portions of RADIUS messages. See also RADIUS (page 246).

shortcut

A file that contains only the location of another file on your computer.

smart drive

See USB drive (page 249).

SMTP

Simple Mail Transfer Protocol. A TCP/IP protocol for sending messages from one computer to another on a network. This protocol is used on the Internet to route email.

SSID

Service Set Identifier. A token (secret key) that identifies a Wi-Fi (802.11) network. The SSID is set up by the network administrator and must be supplied by users who want to join the network.

SSL

Secure Sockets Layer. A protocol developed by Netscape for transmitting private documents on the Internet. SSL works by using a public key to encrypt data that is transferred over the SSL connection. URLs that require an SSL connection start with HTTPS instead of HTTP.

standard e-mail account

See POP3 (page 245).

synchronize

Resolving inconsistencies between backed up files and those stored on your local computer. You synchronize files when the version of the file in the online backup repository is newer than the version of the file on the other computers.

system restore point

A snapshot (image) of the contents of the computer's memory or a database. Windows creates restore points periodically and at the time of significant system events, such as when a program or driver is installed. You can also create and name your own restore points at any time.

SystemGuard

McAfee alerts that detect unauthorized changes to your computer and notify you when they occur.

T

temporary file

A file, created in memory or on disk by the operating system or some other program, to be used during a session and then discarded.

TKIP

Temporal Key Integrity Protocol (pronounced tee-kip). Part of the 802.11i encryption standard for wireless LANs. TKIP is the next generation of WEP, which is used to secure 802.11 wireless LANs. TKIP provides per-packet key mixing, a message integrity check and a re-keying mechanism, thus fixing the flaws of WEP.

Trojan, Trojan horse

A program that does not replicate, but causes damage or compromises the security of the computer. Typically, an individual emails a Trojan horse to you; it does not email itself. You can also unknowingly download the Trojan horse from a website or via peer-to-peer networking.

trusted list

A list of items that you trust and are not being detected. If you trust an item by mistake (for example, a potentially unwanted program or a registry change), or if you want the item to be detected again, you must remove it from this list.

U

U3

You: Simplified, Smarter, Mobile. A platform for running Windows 2000 or Windows XP programs directly from a USB drive. The U3 initiative was founded in 2004 by M-Systems and SanDisk and allows users to run U3 programs on a Windows computer without installing or storing data or settings on the computer.

URL

Uniform Resource Locator. The standard format for Internet addresses.

USB

Universal Serial Bus. An industry-standard connector on most modern computers, that connects multiple devices, ranging from keyboards and mice to webcams, scanners, and printers.

USB drive

A small memory drive that plugs into a computer's USB port. A USB drive acts like a small disk drive, making it easy to transfer files from one computer to another.

USB wireless adapter card

A wireless adapter card that plugs into a USB port in the computer.

V

virus

A computer program that can copy itself and infect a computer without permission or knowledge of the user.

VPN

Virtual Private Network. A private communications network that is configured through a host network such as the Internet. The data traveling through a VPN connection is encrypted and possesses strong security features.

W

wardriver

A person who searches for Wi-Fi (802.11) networks by driving through cities armed with a Wi-Fi computer and some special hardware or software.

watch file types

The types of files (for example, .doc, .xls) that Backup and Restore archives or backs up within the watch locations.

watch locations

The folders on your computer that Backup and Restore monitors.

web bugs

Small graphics files that can embed themselves in your HTML pages and allow an unauthorized source to set cookies on your computer. These cookies can then transmit information to the unauthorized source. Web bugs are also called “web beacons,” “pixel tags,” “clear GIFs,” or “invisible GIFs.”

webmail

Web-based mail. Electronic mail service accessed primarily via a web browser rather than through a computer-based email client such as Microsoft Outlook. See also email (page 241).

WEP

Wired Equivalent Privacy. An encryption and authentication protocol defined as part of the Wi-Fi (802.11) standard. Initial versions are based on RC4 ciphers and have significant weaknesses. WEP attempts to provide security by encrypting data over radio waves so that it is protected as it is transmitted from one end point to another. However, it has been found that WEP is not as secure as once believed.

whitelist

A list of websites or email addresses considered safe. Websites on a whitelist are those users are allowed to access. Email addresses on a whitelist are from trusted sources whose messages you want to receive. Compare to blacklist (page 240).

Wi-Fi

Wireless Fidelity. A term used by the Wi-Fi Alliance when referring to any type of 802.11 network.

Wi-Fi Alliance

An organization comprised of leading wireless hardware and software providers. The Wi-Fi Alliance strives to certify all 802.11-based products for interoperability and promote the term Wi-Fi as the global brand name across all markets for any 802.11-based wireless LAN products. The organization serves as a consortium, testing laboratory, and clearinghouse for vendors who want to promote the growth of the industry.

Wi-Fi Certified

To be tested and approved by the Wi-Fi Alliance. Wi-Fi certified products are deemed interoperable even though they might originate from different manufacturers. A user with a Wi-Fi certified product can use any brand of access point (AP) with any other brand of client hardware that also is certified.

wireless adapter

A device that adds wireless capability to a computer or PDA. It is attached via a USB port, PC Card (CardBus) slot, memory card slot, or internally into the PCI bus.

WLAN

Wireless Local Area Network. A local area network (LAN) using a wireless connection. A WLAN uses high-frequency radio waves rather than wires to allow computers to communicate with each other.

worm

A virus that spreads by creating duplicates of itself on other drives, systems, or networks. A mass-mailing worm is one that requires a user's intervention to spread, e.g., opening an attachment or executing a downloaded file. Most of today's email viruses are worms. A self-propagating worm does not need user intervention to propagate. Examples of self-propagating worms include Blaster and Sasser.

WPA

Wi-Fi Protected Access. A specification standard that strongly increases the level of data protection and access control for existing and future wireless LAN systems. Designed to run on existing hardware as a software upgrade, WPA is derived from, and is compatible with, the 802.11i standard. When properly installed, it provides wireless LAN users with a high level of assurance that their data remains protected and that only authorized network users can access the network.

WPA-PSK

A special WPA mode designed for home users who do not require strong enterprise-class security and do not have access to authentication servers. In this mode, the home user manually enters the starting password to activate Wi-Fi Protected Access in Pre-Shared Key mode, and should change the pass-phrase on each wireless computer and access point regularly. See also WPA2-PSK (page 251), TKIP (page 248).

WPA2

An update to the WPA security standard, based on the 802.11i standard.

WPA2-PSK

A special WPA mode that is similar to WPA-PSK and is based on the WPA2 standard. A common feature of WPA2-PSK is that devices often support multiple encryption modes (for example, AES, TKIP) simultaneously, while older devices generally support only a single encryption mode at a time (that is, all clients would have to use the same encryption mode).

About McAfee

McAfee, Inc., headquartered in Santa Clara, California and the global leader in Intrusion Prevention and Security Risk Management, delivers proactive and proven solutions and services that secure systems and networks around the world. With its unmatched security expertise and commitment to innovation, McAfee empowers home users, businesses, the public sector, and service providers with the ability to block attacks, prevent disruptions, and continuously track and improve their security.

License

NOTICE TO ALL USERS: CAREFULLY READ THE APPROPRIATE LEGAL AGREEMENT CORRESPONDING TO THE LICENSE YOU PURCHASED, WHICH SETS FORTH THE GENERAL TERMS AND CONDITIONS FOR THE USE OF THE LICENSED SOFTWARE. IF YOU DO NOT KNOW WHICH TYPE OF LICENSE YOU HAVE ACQUIRED, PLEASE CONSULT THE SALES AND OTHER RELATED LICENSE GRANT OR PURCHASE ORDER DOCUMENTS THAT ACCOMPANIES YOUR SOFTWARE PACKAGING OR THAT YOU HAVE RECEIVED SEPARATELY AS PART OF THE PURCHASE (AS A BOOKLET, A FILE ON THE PRODUCT CD, OR A FILE AVAILABLE ON THE WEB SITE FROM WHICH YOU DOWNLOADED THE SOFTWARE PACKAGE). IF YOU DO NOT AGREE TO ALL OF THE TERMS SET FORTH IN THE AGREEMENT, DO NOT INSTALL THE SOFTWARE. IF APPLICABLE, YOU MAY RETURN THE PRODUCT TO MCAFEE, INC. OR THE PLACE OF PURCHASE FOR A FULL REFUND.

AVERT, EPO, EPOLICY ORCHESTRATOR, FLASHBOX, FOUNDSTONE, GROUPSHIELD, HERCULES, INTRUSHIELD, INTRUSION INTELLIGENCE, LINUXSHIELD, MANAGED MAIL PROTECTION, MAX (MCAFEE SECURITYALLIANCE EXCHANGE), MCAFEE, MCAFEE.COM, NETSHIELD, PORTALSHIELD, PREVENTSYS, PROTECTION-IN-DEPTH STRATEGY, PROTECTIONPILOT, SECURE MESSAGING SERVICE, SECURITYALLIANCE, SITEADVISOR, THREATSCAN, TOTAL PROTECTION, VIREX, VIRUSSCAN.

CHAPTER 50

Customer and Technical Support

SecurityCenter reports critical and non-critical protection problems as soon as it detects them. Critical protection problems require immediate action and compromise your protection status (changing the color to red). Non-critical protection problems do not require immediate action and may or may not compromise your protection status (depending on the type of problem). To achieve a green protection status, you must fix all critical problems and either fix or ignore all non-critical problems. If you need help diagnosing your protection problems, you can run McAfee Virtual Technician. For more information about McAfee Virtual Technician, see the McAfee Virtual Technician help.

If you purchased your security software from a partner or provider other than McAfee, open a Web browser, and go to www.mcafeehelp.com. Then, under Partner Links, select your partner or provider to access McAfee Virtual Technician.

Note: To install and run Virtual Technician, you must log in to your computer as a Windows Administrator. If you don't, Virtual Technician may not be able to resolve your issues. For information about logging in as a Windows Administrator, see the Windows Help. In Windows Vista™, you are prompted when you run Virtual Technician. When this happens, click **Accept**. The Virtual Technician does not work with Mozilla® Firefox.

In this chapter

Using McAfee Virtual Technician256

Using McAfee Virtual Technician

Like a personal, technical support representative, Virtual Technician collects information about your SecurityCenter programs so that it can help resolve your computer's protection problems. When you run Virtual Technician, it checks to make sure your SecurityCenter programs are working correctly. If it discovers problems, Virtual Technician offers to fix them for you or provides you with more detailed information about them. When finished, Virtual Technician displays the results of its analysis and allows you to seek additional technical support from McAfee, if necessary.

To maintain the security and integrity of your computer and files, Virtual Technician does not collect personal, identifiable information.

Note: For more information about Virtual Technician, click the **Help** icon in Virtual Technician.

Launch Virtual Technician

Virtual Technician collects information about your SecurityCenter programs so that it can help resolve your protection problems. To safeguard your privacy, this information does not include personal, identifiable information.

- 1 Under **Common Tasks**, click **McAfee Virtual Technician**.
- 2 Follow the on-screen instructions to download and run Virtual Technician.

Consult the following tables for the McAfee Support and Download sites in your country or region, including User Guides.
